Catalog Numbering

PowerPacT with MicroLogic™ Trip Units

The PowerPacT H-, J-, and L-frame circuit breakers are designed to protect electrical systems from damage caused by overloads and short circuits. H- and J-frame circuit breakers are available with either thermal-magnetic or MicroLogic electronic trip units. L-frame circuit breakers are available with basic electronic or MicroLogic electronic trip units only.

Direct Access to Energy Management

The new generation PowerPacT with MicroLogic circuit breakers set the standard with direct access to energy management. Integrated metering enhances their protective functions. For the first time, Schneider Electric users can monitor energy from 15 to 3000 A, offering new performance in a remarkably compact device.

- Smart – A meter in every breaker
- Safe – Combines safety and performance in one compact device
- Simple – To select, install, and use

Increased energy availability

Safety and Protection

Energy measurement and control

	D87	500 Vdc 30–70 A H-Frame Molded Case Circuit Breaker
	Dxx	500 Vdc 300 A–1200 A L-Frame Molded Case Circuit Breaker (Refer to for details.)
	R	100% Rated Continuous Current Rating Complete Circuit Breaker (frame + removable trip unit)

5. 100% ratings valid for:
 Three-pole H and J frame unit mount and busbar connection
 Three-pole or four-pole L-frame 250 A and 400 A unit mount
 Three-pole L-frame 250 A and 400 A I-Line
6. 100% rated is not available on PowerPacT L basic electronic trip units.

Accessory Suffix Codes

The following tables provide suffix codes for factory installed accessories (building sequence as listed) and the numbers of field installable kits.

Communication Networks⁷

Suffix	Description	Kit No.
EA	NSX ULP Cord 1.3 m, V ≤ 480 V	S434201
EB	NSX ULP Cord 3 m, V ≤ 480 V	S434202
ED	NSX ULP Cord 1.3 m, V > 480 V	S434204
EE	NSX ULP Cord 3 m, V > 480 V	S434303
EG ⁸	BSCM with NSX ULP Cord 1.3m V ≤ 480 Vac	S434201BX
EH ⁸	BSCM with NSX ULP Cord 3.0m V ≤ 480 Vac	S434202BX
EK ⁸	BSCM with NSX ULP Cord 1.3m V > 480 Vac	S434204BX
EL ⁸	BSCM with NSX ULP Cord 3.0m V > 480 Vac	S434303BX
EN	24 Vdc Power Supply Terminal Block	S434210
EP	BSCM with MB SL Cord 3.0m for V ≤ 480 Vac ⁹	S434223BX
ER	BSCM with MB SL Cord 1.3m for V ≤ 480 Vac ⁹	S434222BX
ES	BSCM with MB SL Cord 0.35m for V ≤ 480 Vac ⁹	S434221BX

Indication Contacts

Suffix	Description	Kit No.
V	SDX	S429532
	SDTAM (motor only trip units)	S429424

Auxiliary Switch

Suffix	Contacts	Kit No.	Kit Qty.
AA	1A/1B Standard	S29450	1
AB	2A/2B Standard	S29450	2
AC	3A/3B Standard (L-frame only)	S29450	3
AE	1A/1B Low-Level	S29452	1
AF	2A/2B Low-Level	S29452	2
AG	3A/3B Low Level (L-frame only)	S29452	3

7. Except for suffix EN, EP, ER, and ES, installation requires IFM (STRV00210) for Modbus communication and/or FDM (STRV00121) for external display.

8. Use with a motor operator requires Communicating Motor Operator (suffix NC).

9. Modbus serial only ≤ 480 Vac. Use only with matching Modbus serial components.

14. MN / MX — Screw Version — as Kit only

15. Kit only

16. I-Line wire harness included for communication network accessories.

Optional wire harness for unit mount requires YH1 suffix.

General Information

The PowerPacT H-, J-, and L-frame circuit breakers are designed to protect electrical systems from damage caused by overloads and short circuits. H- and J-frame circuit breakers are available with either thermal-magnetic or MicroLogic electronic trip units. L-frame circuit breakers are available with MicroLogic electronic trip units only.

H- and J-frame circuit breakers with thermal-magnetic trip units contain individual thermal (overload) and instantaneous (short circuit) sensing elements in each pole. The amperage ratings of the thermal trip elements are calibrated at 104°F (40°C) free air ambient temperature. Per the National Electric Code® (NEC®) and the Canadian Electrical Code, standard circuit breakers may only be applied continuously at up to 80% of their rating. Circuit breakers rated for 100% operation are available but require specially-designed enclosures and 194°F (90°C) rated wire.

Devices with the MicroLogic electronic trip unit provide adjustable protection settings for greater system flexibility. In addition to electronic protection, MicroLogic trip units allow users to monitor both energy and power. Through direct access to in-depth information and networking using open protocols, PowerPacT circuit breakers with MicroLogic trip units let operators optimize the management of their electrical installations. Far more than just a circuit breaker, these devices are a measurement and communication tool ready to meet energy-efficiency needs through optimized power requirements, increased energy availability, and improved installation management.

PowerPacT™ H-, J-, and L-frame will include the industries only LED locator in an MCCB called Visi-Trip. Visi-Trip is designed to provide a visual light alert when a breaker needs to be inspected, increasing safety and saving customers time finding the concern and allowing them to being the troubleshooting process faster.

Applications

PowerPacT H-, J- and L-frame circuit breakers offer high performance and a wide range of interchangeable trip units to protect most applications.

Electronic trip units provide highly accurate protection with wide setting ranges and can integrate measurement, metering and communication functions. They can be combined with the front display module (FDM121) to provide functions similar to a power meter.

	Power Meter	PowerPacT H-, J-, and L-frame circuit breakers equipped with MicroLogic 5/6 trip units offer type A (ammeter) or E (energy) metering functions as well as communication capability. Using MicroLogic trip unit sensors and intelligence, PowerPacT H-, J-, and L-frame circuit breakers provide access to measurements of all the main electrical parameters on the built-in screen, on a dedicated front display module (FDM121) or through the communication network.
	Operating assistance	Integration of measurement functions provides operators with operating assistance functions including alarms tripped by user-selected measurement values, time-stamped event tables and histories, and maintenance indicators.
	Front display module	The main measurements can be read on the built-in screen of MicroLogic 5/6 trip units. They can also be displayed on the equipment FDM121 along with pop-up windows signalling the main alarms.
	Communication network	PowerPacT H-, J-, and L-frame circuit breakers equipped with MicroLogic 5/6 trip units provide communication capabilities. Simple RJ45 cables connect to a Modbus communication interface module.

Applications

	Protection of distribution systems	The PowerPacT H-, J-, and L-frame circuit breakers provide protection against short circuits and overloads for: • distribution systems supplied by transformers • distribution systems supplied by engine generator sets They are easily installed at all levels in distribution systems, from the main LV switchboard to the subdistribution boards and enclosures. All PowerPacT circuit breakers can protect against insulation faults by adding an external Vigirex relay.
	Mission critical applications	The PowerPacT H-, J-, and L-frame mission critical circuit breakers provide high levels of selective coordination with QO and ED/EG/EJ circuit breakers.
	Protection of motors	The PowerPacT H-, J-, and L-frame circuit breakers include a number of versions to protect motor applications: • basic short-circuit protection with electronic instantaneous only MCP or the electronic MicroLogic 1.3 M trip units, combined with a special overload relay to provide thermal protection • protection against overloads, short circuit and phase unbalance or loss with MicroLogic 2 M trip units The exceptional limiting capacity of the PowerPacT circuit breakers automatically provides coordination with the motor starter.
	Protection of special applications	The PowerPacT H-, J-, and L-frame circuit breakers offer a number of versions for special protection applications: • industrial control panels with: — compliance with international standards IEC 60947-2 and UL 508/CSA 22.2 N°14 — compliance with UL 489 — installation in universal and functional enclosures • 400 Hz systems
	Control using automatic switches	An automatic switch version of PowerPacT H-, J-, and L-frame circuit breakers is available for circuit control. All add-on functions for the circuit breakers may be combined with the basic automatic switch function, including motor operators. For information on other automatic switches, contact Schneider Electric.
	Manual transfer systems	To ensure a continuous supply of power, some electrical installations are connected to two power systems: • the normal source, usually the utility (U) • a replacement source to supply the installation when the normal source is not available, generally from a generator (G) A mechanical and/or electrical interlocking system between two circuit breakers or automatic switches helps minimize risk of parallel connection of the sources during switching. A system can be manual transfer mechanical device interlocking.

Mission Critical Circuit Breakers

The PowerPacT J- and L-Frame Mission Critical circuit breakers deliver high levels of selective coordination in a flexible design that can be easily configured for a variety of applications. Tested to be selectively coordinated with the QO family of miniature circuit breakers and the ED, EG, and EJ circuit breakers, this solution provides peace of mind when power availability is critical.

An electronic trip unit provides adjustable long-time settings in three sensor sizes, allowing coverage from 70 through 600 A on 120–240, 208Y/120, 240, and 480Y/277 V systems.

Ratings	Available Configurations
UL 489 Listed CSA Certified Voltage: 480Y/277 V	• I-Line mounting • Main circuit breaker in NQ and NF panelboards • Unit mount for OEM users • Plug-in base for OEM users • Drawout base for OEM users

In addition to unique design attributes, the PowerPacT Mission Critical circuit breakers have also undergone rigorous testing procedures to certify the coordination with downstream circuit breakers— combining innovative engineering with validated test results.

Apply Schneider Electric Mission Critical circuit breakers in emergency power distribution systems, data centers, hospitals, or anywhere continuity of service is desired

Theory of Operation

There are several dynamic forces between the PowerPacT Mission Critical circuit breakers and downstream circuit breakers when a fault occurs downstream of the branch circuit breaker. Many of these events cannot be shown on the trip curve.

The PowerPacT Mission Critical circuit breakers analyze the fault current to make decisions which maximize selectivity with downstream circuit breakers. The trip units deploy a special selectivity delay to allow downstream circuit breakers to clear. However, on very high faults or if the downstream circuit breaker does not trip, the circuit breaker trips the mechanism instantaneously.

The combination of the PowerPacT Mission Critical circuit breaker and downstream circuit breakers shown in the selectivity charts in the instruction bulletin are selective due to the fact that the series impedance and the let-through from the downstream circuit breaker does not produce enough energy to trip the PowerPacT Mission Circuit circuit breaker.

This system maximizes the interaction of the circuit breakers in series to allow selectivity.

Trip Units and Trip Curves

The PowerPacT J- and L-Frame Mission Critical circuit breakers deliver high levels of selective coordination with the QO family of miniature circuit breakers and the ED, EG, and EJ circuit breakers in a flexible design that can be easily configured for a variety of applications. These circuit breaker can be equipped with 3.2-W, 3.2S-W, 5.2A-W, 5.2E-W, 6.2A-W, 3.3S-W, 5.3A-W, 6.3A-2, and 6.3E-2 MicroLogic trip units. See the catalog numbers and references beginning in J-Frame 250 A Mission Critical Electronic Trip UL Rated Circuit Breakers (Three-Pole, 480Y/277 Vac, 50/60 Hz) With Factory-Sealed Trip Unit Suitable for Reverse Connection, page 45.

The mission critical trip units have the same settings and trip curves as the standard trip units described in this document.

For more information see the trip unit user guides 48940-310-01 and 48940-312-01 on the Schneider Electric website.

J-frame mission critical circuit breakers are selective with QO or E-frame circuit breakers per the table below when the amperage of the main circuit breaker is at least two times the amperage of the branch circuit breaker.

J-Frame Selectivity with QO and E-Frame Circuit Breakers

Circuit Breaker ¹⁷		Voltage		Current	One-Line Diagram
Main	Branch				
J-W, 250 A	QO(B) QO(B)-H QO(B)-VH QH	1P, 2P	10–30 A	240/120 V 120 V	18 kA
			35–60 A		15 kA
			70–125 A		12 kA
		3P	10–30 A	240 V 208 V	15 kA
			35–60 A		13 kA
			70–125 A		10 kA
J-W, 250 A	E-Frame	1P, 2P, 3P	15–125 A	240 V	18 kA
			15–60 A	480Y/277 V	10 kA
			70–125 A		7 kA

L-frame mission critical circuit breakers are selective with QO-style and E-frame circuit breakers per the table below when the amperage of the main circuit breaker is at least two times greater than the amperage of the branch circuit breaker.

L-Frame Selectivity with QO and E-Frame Circuit Breakers

Circuit Breaker ¹⁷			Voltage	Current	One-Line Diagram
Main	Branch				
L-W, 250 A	QO(B) QO(B)-H QO(B)-VH QH	10–60 A	240 V	18 kA	
		70–125 A		10 kA	
L-W, 400 A L-W, 600 A	QO(B) QO(B)-H QO(B)-VH QH	15–150 A	240 V	30 kA

			480Y/277	30 kA	

17. Including AFI, CAFI, EPD and GFI circuit breakers.

Flexible Configurations

The PowerPacT H-, J- and L-frame circuit breakers may be configured with lugs, bus bar connections, rear connections, I-Line, drawout cradle, or plug-in base.

Field Installable Accessories and Trip Units

Field Installable Accessories and Trip Units

General Characteristics

Faceplate Label

Characteristics indicated on the faceplate label:

- A. Circuit breaker type
- B. Circuit breaker disconnecter symbol
- C. Performance levels
- D. Standards
- E. Ue: Operating voltage per IEC
- F. Icu: Ultimate breaking capacity per IEC
- G. Ics: Service breaking capacity per IEC
- H. Uimp: Rated impulse withstand voltage per IEC
- I. Ui: Insulation voltage per IEC
- J. Certification marks

NOTE: When the circuit breaker is equipped with an extended rotary handle, the door must be opened to view the faceplate.

Codes and Standards

PowerPacT H-, J-, and L-frame circuit breakers, automatic switches and electronic motor circuit protectors are manufactured and tested in accordance with the following standards.

NOTE: Apply circuit breakers according to guidelines detailed in the National Electric Code (NEC) and other local wiring codes.

Codes and Standards

PowerPacT H-, J-, and L-Frame Circuit Breakers	H-, J-, and L-Frame Switches	Motor Circuit Protectors
UL 489 ¹⁸ IEC 60947-2 CSA C22.2 No. 5 ¹⁹ Federal Specification W-C-375B/GEN NEMA AB1 NMX J-266 CCC CE and UKCA Marking	UL 489 ²⁰ IEC 60947-3 CSA C22.2 No. 5 ^{21,22} Federal Specification W-C-375B/GEN NEMA AB1 NMX J-266 CE and UKCA Marking	UL 508 IEC 60947-2 CSA C22.2 No. 14 NEMA AB1 CCC CE and UKCA Marking

18. PowerPacT H-J, and L-frame circuit breakers are in UL File E10027.
19. PowerPacT H- and J-frame circuit breakers are in CSA File 153555-1534832. PowerPacT L-frame circuit breakers are in CSA File 177007-2457072..
20. PowerPacT H- and J-frame switches are in UL File E33117.
21. PowerPacT H- and J-frame switches are in CSA File 153555-1544371.
22. PowerPacT L-frame switches are in CSA File 177007-70012744.

Vibration

PowerPacT H-, J-, and L-frame devices resist mechanical vibration.

Tests are carried out in compliance with standard UL 489 SA and SB for the levels required by merchant-marine inspection organizations (Veritas®, Lloyd's®, etc.):

PowerPacT H-, J-, and L-frame circuit breaker meet IEC 60068-2-6 for vibration:

- 2.0 to 25.0 Hz and amplitude +/- 1.6 mm
- 25.0 to 100 Hz acceleration +/- 4.0 g

Excessive vibration may cause tripping, breaks in connections or damage to mechanical parts.

Electromagnetic Disturbances

PowerPacT H-, J-, and L-frame devices are protected against:

- overvoltages caused by circuit switching
- overvoltages caused by an atmospheric disturbances or by a distribution-system outage (such as from failure due to lightning)
- devices emitting radio waves (radios, walkie-talkies, radar, etc.)
- electrostatic discharges produced directly by users

PowerPacT H-, J-, and L-frame devices have successfully passed the electromagnetic-compatibility

tests (EMC) defined by the following international standards:

- IEC/EN 60947-2: Low-voltage switchgear and controlgear, part 2: Circuit breakers:
 - Annex F: Immunity tests for circuit breakers with electronic protection
 - Annex B: Immunity tests for residual current protection
- IEC/EN 61000-4-2: Electrostatic-discharge immunity tests
- IEC/EN 61000-4-3: Radiated, radio-frequency, electromagnetic-field immunity tests
- IEC/EN 61000-4-4: Electrical fast transient/burst immunity tests
- IEC/EN 61000-4-5: Surge immunity tests
- IEC/EN 61000-4-6: Immunity tests for conducted disturbances induced by radio frequency fields
- CISPR 11: Limits and methods of measurement of electromagnetic disturbance characteristics of industrial, scientific and medical (ISM) radio-frequency equipment.

These tests ensure that:

- no nuisance tripping occurs due to electromagnetic disturbances
- tripping times are respected

Tropicalization

The materials used in PowerPacT circuit breakers will not support the growth of fungus and mold.

PowerPacT circuit breakers have passed the test defined below for extreme atmospheric conditions.

Dry cold and dry heat:

- IEC 60068-2-1 — Test A: Cold at +55°C
- IEC 60068-2-2 — Dry Heat at +85°C

Damp heat (tropicalization)

- IEC 60068-2-30 — damp heat (temperature 55°C and 95% relative humidity)
- IEC 60068-2-52 — salt mist

Special Ratings

The H-frame and J-frame circuit breakers also comply with the following special ratings:

- HACR rating
- SWD switch duty rating (applies only to 15 and 20 A / 277 Vac or less, two- and three-pole)
- HID high intensity discharge lighting rating (15–50 A)

The L-frame circuit breakers complies with the following special rating:

- HACR rating

Marine Ratings

UL Marine Listed/CSA Certified Circuit Breakers (UL 489 Supplement SA)

The PowerPacT H- and J-frame circuit breakers with thermal-magnetic trip units with D, G, J and L interruption levels meet the UL 489 Supplement SA requirements for use on vessels of any length under or over 65 ft. (19.8 m). The PowerPacT H-, J-, and L-frame circuit breakers with MicroLogic electronic trip units meet the UL 489 Supplement SA for use on vessels over 65 ft. (19.8 m) in length. Marine circuit breakers must not use aluminum or aluminum alloys for terminal connections and must be calibrated at an ambient temperature of 104°F (40°C). Standard circuit breakers should not be specified or used in the place of marine rated circuit breakers. Circuit breakers can be ordered with the Marine SA listing by adding the suffix “YA” (marine) to the catalog number.

UL Naval Listed/CSA Certified Circuit Breakers (UL 489 Supplement SB)

The PowerPacT H-, J-, and L-frame circuit breakers with MicroLogic trip units with D, G, J and L interruption levels meet the UL 489 Supplement SB requirements for use on naval vessels. These circuit breakers are subject to various vibration tests as described in UL 489 Supplement SB. Naval circuit breakers must not use aluminum or aluminum alloys for terminal connections and must be calibrated at an ambient temperature of 122°F (50°C). Standard circuit breakers should not be specified or used in the place of navel rated circuit breakers. Circuit breakers can be ordered with the Naval SB listing by adding the suffix “YA1” (naval) to the catalog number.

American Bureau of Shipping (ABS)

The PowerPacT H-, J-, and L-Frame circuit breakers are certified to ABS-NVR (American Bureau of Shipping - Naval Vessel Rules), for use on Naval vessels.

UL 489 SC Listed 500 Vdc Circuit Breakers

The UL Listed / CSA Certified thermal-magnetic H-, J-, and L-frame molded case circuit breakers are specifically designed for use on ungrounded dc systems having a maximum short-circuit voltage of 500 Vdc or a maximum floating (unloaded) voltage of 600 Vdc. The circuit breakers are suitable for use only with UPS (uninterruptable power supplies) and ungrounded systems. This two-level voltage rating allows these circuit breakers to be applied to battery sources having a short-circuit availability of 20,000 or 50,000 amperes at 500 Vdc.

These circuit breakers are UL Listed/CSA Certified for the interrupting ratings shown only if applied with three poles connected in series (series connection is external to circuit breaker). See diagram below.

NOTE: Due to external series connection, I-Line circuit breakers are not available for this application.

37. The LSI with 3.2S/3.3S trip units have fixed short time and long time delays.

38. Requires neutral current transformer on three-phase four-wire loads.

39. ZSI for H/J-frame devices is only OUT. ZSI for L-frame devices is IN and OUT.

40. Indication available using the communication system only.

41. % of hours in 4 current ranges: 0–49%, 50–79%, 80–89%, and >90% In.

Thermal-Magnetic or Electronic Trip Unit

Thermal-magnetic trip units (available on H- and J-frame circuit breakers only) protect against overcurrents and short-circuits using tried and true techniques. For applications requiring installation optimization and energy efficiency, electronic trip units offer more advanced protection functions combined with measurements.

Trip units using digital electronics are faster as well as more accurate. Wide setting ranges make installation upgrades easier. Designed with processing capabilities, MicroLogic trip units can provide measurement information and device operating assistance. With this information, users can avoid or deal more effectively with disturbances and can play a more active role in system operation. They can manage the installation, anticipate events and plan any necessary servicing.

Accurate Measurements for Complete Protection

PowerPacT H-, J-, and L-frame circuit breakers offer excellent measurement accuracy from 15 amperes on up to the short-circuit currents. This is made possible by a new generation of current transformers combining “iron-core” sensors for self-powered electronics and “air core” sensors (Rogowski coils) for measurements. The protection functions are managed by an ASIC (Application Specific Integrated Circuit) component that is independent of the measurement functions. This independence ensures immunity to conducted and radiated disturbances and increases reliability.

Numerous Security Functions

Torque-limiting screws	The screws secure the trip unit to the circuit breaker. When the correct tightening torque is reached, the screw heads break off. Optimum tightening avoids any risk of temperature rise. A torque wrench is no longer required.
Easy and sure changing of trip units	All trip units are interchangeable, without wiring. A mechanical mismatch-protection system minimizes the possibility of mounting a trip unit on a circuit breaker with a lower rating. ⁴²
“Ready” LED for a continuous self-test	The LED on the front of the electronic trip units indicates the result of the self-test running continuously on the measurement system and the tripping release. As long as the green LED is flashing, the links between the CTs, the processing electronics and the tripping mechanism are operational. The circuit breaker is ready to protect. A minimum current of 15 to 50 A, depending on the device, is required for this indication function.
A patented dual adjustment system for protection functions	Available on MicroLogic 5/6 trip units, the system consists of: • an adjustment using rotary switches sets the maximum value • an adjustment using the keypad or made remotely fine-tunes the setting. This setting may not exceed the first one. It can be read directly on the MicroLogic trip unit screen, to within one ampere and a fraction of a second.

42. Breaker must be ordered with removable trip unit. Refer to page 9 for additional detail.

Circuit Breakers

Dual-Break Rotating Contacts

Reduced Let-Through Currents

All PowerPacT H-, J-, and L-frame circuit breakers are equipped with dual-break rotating contacts that reduce the amount of peak current during a short-circuit fault. This reduces the let-through currents and enhances equipment protection.

The moving contact has the shape of an elongated “S” and rotates around a floating axis. The shape of the fixed and moving contacts are such that the repelling forces appear as soon as the circuit reaches approximately 15 times I_n . Due to the rotating movement, repulsion is rapid and the device greatly limits short-circuit currents, whatever the interrupting level of the unit (D, G, J or L). The fault current is extinguished before it can fully develop. Lower let-through currents provide less peak energy, reducing the required busbar bracing, lowering enclosure pressure, and delivering improved series or combination ratings. See [Current-Limiting](#), page 36.

High Ampere Interrupting Ratings (AIR)

Circuit breakers are available with interrupting ratings up to:

- 200 kA at 240 Vac delta
- 200 kA at 480 Vac delta
- 100 kA at 600 Vac delta.

See Interrupting Rating, page 11 for additional performance levels.

Internal Operating Mechanism

Push-to-Trip

PowerPacT H-, J-, and L-frame circuit breakers have an over-center toggle mechanism providing quick-make, quick-break operation. The operating mechanism is also trip-free, which allows tripping even when the circuit breaker handle is held in the “ON” position. Internal cross-bars provide common opening and closing of all poles with a single operating handle.

All PowerPacT circuit breakers have an integral push-to-trip button in the cover to manually trip the circuit breaker. This should be used as part of a regular preventive maintenance program.

Handle Position Indication

The circuit breaker handle can assume any of three positions, ON, tripped or OFF as shown. The center tripped position provides positive visual indication that the circuit breaker has tripped.

The circuit breaker can be reset by first pushing the handle to the extreme “OFF” position. Power can then be restored to the load by pushing the handle to the “ON” position.

Visi-Trip Breaker Locator

Provides a visual light alert when a breaker may require attention.

The Visi-Trip LED handle aids in quickly locating a circuit breaker that requires attention. Inspect the handle position for circuit breaker trip indication. The VisiTrip handle will flash an LED light as described in the table below.

Wait five seconds between handle operation and push-to-trip button operation to ensure that the Visi-Trip handle is in standby. Tripping the circuit breaker too soon after toggling may result in the Visi-Trip handle not operating as intended. If a nuisance LED flashing occurs, it can be reset by toggling the circuit breaker. If toggling the circuit breaker is not desired, LED flashing will reset after six hours. When performing annual maintenance in accordance with MCCB Field Testing and Maintenance Guide (0600IB1201), operate the push to trip button (if equipped) to verify the Visi-Trip functionality. Cycle the circuit breaker from tripped to OFF, and then from OFF to ON and take note of the battery health.

Light Pattern	Indicator
Fast flash for two seconds.	Battery low (20% remaining) ⁴³
Long duration slow flash (continuous flash up to for six hours).	The circuit breaker required inspection.

Circuit Breaker Ratings

The interrupting rating is the highest current at rated voltage the circuit breaker is designed to safely interrupt under standard test conditions. Circuit breakers must be selected with interrupting ratings equal to or greater than the available short-circuit current at the point where the circuit breaker is applied to the system (unless it is a branch device in a series rated combination). Interrupting ratings are shown on Interrupting Rating, page 11 and on the faceplate label on the front of the circuit breaker.

Reverse Feeding of Circuit Breakers

The standard unit-mount H-, J-, and L-frame circuit breakers have sealed trip units and may be reverse fed. For catalog numbers, refer to the following tables:

- PowerPacT H-Frame Standard (80%) Rated 150 A Unit-Mount Thermal-Magnetic Circuit Breakers (600 Vac, 250 Vdc) with Factory-Sealed Trip Unit (Suitable for Reverse Connection), page 41
- PowerPacT H-Frame 100% Rated 150 A Unit-Mount Thermal-Magnetic Circuit Breakers (600 Vac, 250 Vdc) with Factory-Sealed Trip Unit (Suitable for Reverse Connection), page 42
- **L-Frame 600 A Electronic Trip UL Rated Three-Pole Circuit Breakers (600 Vac, 50/60 Hz) With Factory-Sealed Trip Unit Suitable for Reverse Connection**, page 52
- L-Frame 600 A Mission Critical Standard (100 %) Rated Electronic Trip UL Rated Three-Pole Circuit Breakers (480Y/277 Vac, 50/60 Hz) With Factory-Sealed Trip Unit Suitable for Reverse Connection , page 52
- L-Frame 600 A Electronic Trip UL Rated Four-Pole Circuit Breakers (600 Vac, 50/60 Hz) With Factory-Sealed Trip Unit Suitable for Reverse Connection , page 53

43. Contact Schneider Electric services for replacement detail.

- **L-Frame 600 A Mission Critical Standard (80%) Rated Electronic Trip UL Rated Four-Pole Circuit Breakers (480Y/277 Vac, 50/60 Hz) With Factory-Sealed Trip Unit Suitable for Reverse Connection** , page 54
- L-Frame 600 A I-Line Standard (80%) Rated Electronic Trip UL Rated Circuit Breakers (600 Vac, 50/60 Hz) With Factory-Sealed Trip Unit Suitable for Reverse Connection , page 54
- L-Frame 600 A Mission Critical I-Line Standard (80%) Rated Electronic Trip UL Rated Circuit Breakers (480/277 Vac, 50/60 Hz) With Factory Sealed Trip Units Suitable for Reverse Connection, page 55
- L-Frame 250 A and 400 A I-Line 100% Rated Electronic Trip UL Rated Circuit Breakers (600 Vac, 50/60 Hz) With Factory Sealed Trip Unit Suitable for Reverse Connection , page 55
- L-Frame 3-Pole, 600 A Circuit Breakers with Lugs and Field-Interchangeable Electronic Trip Units (600 Vac, 50/60 Hz), page 56
-

Circuit breakers with field-interchangeable trip units (designated by the suffix T or R and labeled “LINE” and “LOAD”) cannot be reverse fed. Neither can circuit breaker frames without terminations or trip units.

Current-Limiting

The current-limiting attributes of PowerPacT H-, J-, and L-frame circuit breakers provide greater protection for downstream devices by limiting the let-through current in the event of a fault. The current-limiting capabilities of HJ/HL/HR, JJ/JL/JR, and LJ/LL/LR frame circuit breakers are documented with Underwriters Laboratories and Canadian Standards Association. These current-limiting circuit breakers ship with a label that identifies them as UL/CSA Current-Limiting Circuit Breakers. (The HD/HG, JD/JG, and LD/LG circuit breakers do not carry the UL Current-Limiting label).

The trip curves with let-through data are available in the trip curve section in this catalog, see [Trip Curves](#), page 237.

Please note that as let-through curves for UL Listed / CSA Certified Current-Limiting Circuit Breakers, these curves are maximum let-through values.

100% Rated

Some models of the H-, J-, and L-frame circuit breakers are UL Listed / CSA Certified to be applied at up to 100% of their current rating. Because of the additional heat generated, the use of specially-designed enclosures on H- and J-frame circuit breakers and 194°F (90°C) rated wire is required when applying circuit breakers at 100% of continuous current rating. (H-, J-, and L-frame circuit breakers can use aluminum or copper lugs.) Markings on the circuit breaker indicate the minimum enclosure size and ventilation required. The 194°F (90°C) wire must be sized according to the ampacities of the 167°F (75°C) wire column in the NEC. Circuit breakers with 100% rating can also be used in applications requiring only standard (80%) continuous loading.

100% ratings are valid for:

- Three-pole H/J-frame unit mount and busbar connection
- Three- pole/four-pole L-frame 250 A and 400 A unit mount
- Three-pole L-frame 250 A and 400 A I-Line
- Rear connection and switches

Corner-Grounded Delta Ratings (1Ø-3Ø)

Circuit breakers suitable for corner-grounded circuits are marked 1Ø-3Ø. For additional information, refer to data bulletin 2700DB0202, *Corner-Grounded Delta (Grounded B Phase) Systems*.

Corner-Grounded Delta Ratings (1Ø-3Ø)

	Two-Pole H-Frame					Two-Pole J-Frame				
	HD	HG	HJ ⁴⁴	HL ⁴⁴	HR ⁴⁴	JD ⁴⁴	JG ⁴⁴	JJ ⁴⁴	JL ⁴⁴	JR ⁴⁴
Ampere Rating (A)	15–150					150–250				
Voltage Rating (Vac)	240					240				
UL Interrupting Rating (kA)	42	42	65	100	–	42	42	65	100	–

Three-Phase 240 Vac Corner-Grounded Delta System

44. Built using three-pole module.

Special Applications

Protection of Industrial Control Panels

PowerPacT H-, J-, and L-frame circuit breakers are also used in industrial control panels. They serve as incoming devices or can be combined with contactors to protect motor feeders:

- compliance with worldwide standards including IEC 60947-2 and UL 508 / CSA C22.2 N°14
- overload and short-circuit protection
- installation in universal and functional type

PowerPacT H-, J-, and L-frame circuit breakers equipped for motor protection functions as described in the following pages can be used in industrial control panels. The accessories for the PowerPacT H-, J-, and L-frame circuit breakers are suitable for the special needs of these applications

400 Hz Applications

Impact on Protective Devices

The current in 400 Hz systems has higher losses caused by eddy currents and an increase in the skin effect (reduction in the useful cross-sectional area of conductors). The higher losses cause additional temperature rise in circuit breakers subjected to the higher frequency current. To remain within the rated temperature-rise limits of devices, current derating is required. For circuit breakers equipped with MicroLogic electronic trip units, only the current rating (I_r) must be derated. See “Current Derating Maximum I_r Setting” below. On circuit breakers equipped with thermal-magnetic trip units, the current rating (I_n) must be derated and the magnetic trip setting I_m must be increased. See “Current Rating (I_n) and Magnetic Trip Setting (I_m) Derating” below.

Breaking Capacity in 400 Hz, 480 V Systems

The power levels of 400 Hz applications rarely exceed a few hundred kW with relatively low short-circuit currents, generally not exceeding four times the rated current

Circuit Breaker	Max. Breaking Capacity AIR at 400 Hz
H-frame	10 kA
J-frame	10 kA
L-frame	10 kA

MicroLogic Electronic Trip Units

MicroLogic 3.2/3, 5.2/3 A or E and 6.2/3 with A or E measurement functions are suitable for 400 Hz. The use of electronics offers the advantage of greater operating stability when the frequency varies. However the units are still subject to temperature rise caused by the frequency.

The practical consequences are:

- limit settings: see the I_r derating table below
- the long-time, short-time and instantaneous pick-ups are not modified (see MicroLogic 3 Trip Units, page 106 or MicroLogic 5/6 A or E Trip Units, page 109)
- the accuracy of the displayed measurements is 2% (Class II)

Current Derating Maximum I_r Setting

Circuit Breaker	Maximum Setting Coefficient	Max I_r Setting at 400 Hz
H-frame, 150 A	0.9	135
J-frame, 250 A	0.9	225
L-frame, 400 A	0.8	320
L-frame, 600 A	0.65	390

Thermal-Magnetic Trip Units

Thermal-magnetic trip units require the current rating (I_n) to be derated and the magnetic trip setting (I_m) to be increased.

Current Rating (I_n) and Magnetic Trip Setting (I_m) Derating

Circuit Breaker	Maximum Setting Coefficient	Max I_r Setting at 400 Hz	Magnetic I_m Coefficient at 400 Hz
H-frame, 150 A	0.9	135	1.6
J-frame, 250 A	0.9	225	1.6
L-frame, 400 A	0.8	320	1.6
L-frame, 600 A	0.65	390	1.6

Auxiliary Switch (OF) in 400 Hz Networks

Electrical Characteristics of Auxiliary Switches

Contact		Standard		Low Level	
Utilization cat. (IEC 60947-5-1)		AC12	AC15	AC12	AC15
Operational current	24 V	6 A	6 A	5 A	3 A
	40 V	6 A	6 A	5 A	3 A
	110 V	6 A	5 A	5 A	2.5 A
	200/240 V	6 A	4 A	5 A	2 A
	380/415 V	6 A	2 A	5 A	1.5 A

**Shunt Trip (MX) or Undervoltage Trip (MN) Voltage Release
at 400 Hz and 440 V**

For circuit breakers on 400 Hz systems, only 125 Vdc undervoltage trip (MN) or shunt trip (MX) releases may be used. The release must be supplied by the 400 Hz system through a rectifier bridge (to be selected from the table below) and an additional resistor with characteristics depending on the system voltage.

Rectifier Bridges for MN or MX Releases

Voltage	Rectifier	Additional Resistor
220/240 V	Thomson 110 BHz or General Instrument W06 or Semikron SKB at 1.2/1.3	4.2 k -5 W
380/240 V	Semikron SKB at 1.2/1.3	10.7 k -10 W

84. Circuit breakers will be labeled with Line and Load markings and are not suitable for reverse connections.
Available on three-pole circuit breakers. Not allowed in I-Line, plug-in, or drawout devices. Not available in R interrupting rating.

85. Standard lug kit: AL150HD. Terminal wire range: 14–3/0 AWG Al or Cu.

86. UL Listed/CSA Certified as current-limiting circuit breakers.

87. For 100% rated circuit breakers replace the “T” suffix with “R.” Not available in I-Line, plug-in, or drawout constructions. Not available in R interrupting rating.

88. Standard lug kit: AL175JD. Terminal wire range: 4–4/0 AWG Al or Cu.

89. Standard lug kit: AL250JD. Terminal wire range: 3/0 AWG–350 kcmil Al or Cu.

90. Circuit breakers will be labeled with Line and Load markings and are not suitable for reverse connections.

91. Available on three-pole circuit breakers. Not allowed in I-Line devices. Not available in R interrupting ratings.

92. UL Listed/CSA Certified as current-limiting circuit breakers.

93. Standard lug kit: AL150HD. Terminal wire range: 14–3/0 AWG Al or Cu.

94. For 100% rated circuit breakers replace the “T” suffix with “R.” Not available in I-Line, plug-in, or drawout constructions. Not available in R interrupting rating.

95. Standard lug kit: AL250JD. Terminal wire range: 3/0 AWG–350 kcmil Al or Cu.

For smaller wire range (4–4/0 AWG Al or Cu), replace the lug's wire binding screws with the larger binding screws provided

97. UL Listed/CSA Certified as current-limiting circuit breakers.

98. Three-pole circuit breakers with this trip unit can be used for two-pole applications.

99. Standard lug kit: AL400L61K3. Terminal wire range: (1) 2 AWG–600 kcmil Cu or (1) 2 AWG–500 kcmil Al. Type of terminal shield: short.

100. Standard lug kit: AL600LS52K3. Terminal wire range: (2) 2/0 AWG–500 kcmil Al/Cu. Type of terminal shield: medium.

101. Three-pole circuit breakers with this trip unit can be used for two-pole applications in order to have ground fault protection. Additional metering capabilities will not work properly on the unconnected phase.

102. Standard rating is 100% for 250 and 400 A only. Standard rating is 80% for 600 A.

128. Standard lug kit: AL600LS52K3. Terminal wire range: (2) 2/0 AWG–500 kcmil Al/Cu. Type of terminal shield: medium.

Automatic Switches

Automatic Switch Functions

An automatic switch can be used to open and close a circuit under normal operating conditions. They are similar in construction to circuit breakers, except that the switches open instantaneously at a factory-set, non-adjustable trip point calibrated to protect only the molded case switch.

Molded case switches are intended for use as disconnect devices only. UL489 requires molded case switches to be protected by a circuit breaker or fuse of equivalent rating. Molded case switches are labeled with their appropriate withstand ratings. The withstand rating of a switch is defined as the maximum current at rated voltage that the molded case switch will withstand without damage when protected by a circuit breaker with an equal continuous current rating.

PowerPacT H-, J-, and L-frame automatic switches are available in unit mount, I-Line, plug-in and drawout versions. They use the same accessories and offer the same connection possibilities as the circuit-breaker versions. They may be interlocked with another switch or circuit breaker to form a source-changeover system.

Switches are Listed under UL file E103740 and Certified under CSA file LR88980.

Motor Operator

PowerPacT H-, J-, and L-frame switches equipped with a motor operator module allow remote closing and opening.

Ground Fault Protection (H- and J-Frame Circuit Breakers Only)

An ELM or GFM module may be added to an automatic switch to monitor all leakage currents in the outgoing circuits of the equipment on which the automatic switch is installed. When the ELM or GFM module detects an earth-leakage current, the automatic switch interrupts the load current.

Automatic Switch Protection

The automatic switch can make and break its rated current. For an overload or a short-circuit, it must be protected by an upstream device, in compliance with installation standards. Due to their high-set instantaneous release PowerPacT H-, J- and L-frame automatic switches are self-protected.

Motor Circuit Protection

General Information

The parameters to be considered for motor-feeder protection depend on:

- the application (type of machine driven, operating safety, frequency of operation, etc.)
- the level of continuity of service required by the load or the application
- the applicable standards for the protection of equipment.

The required electrical functions are:

- isolation
- switching, generally at high endurance levels
- protection against overloads and short-circuits, adapted to the motor
- additional special protection.

A motor branch circuit must comply with the requirements of standard UL 508 concerning contactors and their protection:

- coordination of feeder components
- overload relay trip classes.

Motor Branch Circuit Protection Function

A motor branch circuit comprises a set of devices for motor protection and control, as well as for protection of the branch circuit itself.

Switching

The purpose is to control the motor (ON / OFF), either manually, automatically or remotely, taking into account overloads upon start-up and the long service life required. This function is provided by a contactor. When the coil of the contactor's electromagnet is energized, the contactor closes and establishes, through the poles, the circuit between the upstream supply and the motor, through the circuit breaker.

Basic Protection

- Short-circuit protection
Detection and breaking, as quickly as possible, of high short-circuit currents to avoid damage to the installation. This function is provided by a circuit breaker.
- Overload protection
Detection of overload currents and motor shutdown before temperature rise in the motor and conductors damages insulation. This function is provided by a circuit breaker or a separate motor overload relay.
- Phase unbalance or phase loss protection
Phase unbalance or phase loss can cause temperature rise and braking torques that can lead to premature aging of the motor. These effects are even greater during starting, therefore protection must be virtually immediate.

Additional Electronic Protection

- Locked rotor
- Under-load
- Long starts and stalled rotor
- Insulation faults

Trip Class of an Overload Relay Device

The motor branch circuit includes thermal protection that may be built into the circuit breaker. The protection must have a trip class suited to motor starting. Depending on the application, the motor starting time varies from a few seconds (no-load start) to a few dozen seconds (high-inertia load).

Trip Class of Overload Relays as a Function of Their FLA Setting

Class	1.05 FLA ¹³⁷	1.2 FLA ¹³⁷	1.5 FLA ¹³⁸	6.0 FL ¹³⁷
5	$t > 2 \text{ h}$	$t < 2 \text{ h}$	$t < 2 \text{ mn}$	$2 \text{ s} < t \leq 5 \text{ s}$
10	$t > 2 \text{ h}$	$t < 2 \text{ h}$	$t < 4 \text{ mn}$	$4 \text{ s} < t \leq 10 \text{ s}$
20	$t > 2 \text{ h}$	$t < 2 \text{ h}$	$t < 8 \text{ mn}$	$6 \text{ s} < t \leq 20 \text{ s}$

Example: In class 20, the motor must have finished starting within 20 seconds (6 to 20 s) for a starting current of 6 x FLA.

Asynchronous-Motor Starting Parameters

The main parameters of direct on-line starting of three-phase asynchronous motors (90% of all applications) are listed below.

- FLA: full load amperes
This is the current drawn by the motor at full rated load.
- I_d : locked rotor current
This is the current drawn by the motor during starting, on average $6.0 \times I_n$ for a duration of 5 to 30 seconds depending on the application. These values determine the trip class and any additional “long-start” protection devices that may be needed.
- I'_d : peak starting current
This is the sub-transient current during the first two half-waves when the system is energized, on the average $14 I_n$ for 10 to 15 ms (e.g. 1840 A peak).

The protection settings must effectively protect the motor, notably through a suitable overload relay trip class, but let the peak starting current through.

Motor-Feeder Solutions

PowerPacT H-, J-, and L-frame circuit breakers motor circuit breakers are designed for motor-feeder solutions using:

- three devices, including an electronic MCP or 1.3 M instantaneous-only trip unit

¹³⁷. Time for a cold start (motor off and cold).

¹³⁸. Time for warm start (motor running under normal conditions).

- two devices including a 2 M electronic trip unit.

PowerPacT H-, J-, and L-Frame with MicroLogic Trip Units Motor-Protection Range

PowerPacT H-, J-, and L-frame circuit breakers with MicroLogic trip units can be used to create motor-feeder solutions comprising two or three devices. The protection devices are designed for continuous duty at 104°F (40°C).

Three-device solutions

- 1 PowerPacT circuit breaker with MicroLogic 1.3 M trip unit
- 1 contactor
- overload relay

Two-device solutions

- 1 PowerPacT circuit breaker with a MicroLogic 2 M electronic trip unit.
- 1 contactor

Electronic Motor Circuit Protectors (AC Only)

PowerPacT H- and J-frame Electronic Motor Circuit Protectors (MCP) are instantaneous-trip circuit breakers. They are designed to offer short-circuit protection and are National Electrical Code® (NEC®) compliant when installed as part of a combination controller having motor overload protection. MCP circuit breakers accept the same accessories and terminals as the equivalent thermal-magnetic circuit breakers. (See *Accessories and Auxiliaries*, page 144 for Accessories.)

The unique design of the PowerPacT MCPs includes two rotary switches to allow quick setting adjustments based on the characteristics of the motor.

The first rotary switch allows for Full Load Amperes (FLA) adjustment across the range of the frame size.

The second rotary switch selects the type of motor protection based on Automatic 1 for Standard Efficiency or Automatic 2 for High Energy Efficient. When using the automatic settings the MCP microprocessor automatically adjusts the trip settings for both current and time to align with the start-up characteristic for the motor type, whether it is a standard or energy-efficient motor. This includes a dampening means to accommodate a transient motor in-rush current without nuisance tripping of the circuit breaker. Rotary switch 2 also allows for traditional motor protection from 8 to 13 times the selected FLA.

The MCP rotary switches allow the device to be set to specific trip values within a typical accuracy range of +/-5%.

Full Load Ampere Settings

1. Determine the motor's full-load current by referring to the nameplate on the motor.
2. Set the trip range by turning the FLA rotary switch to the setting closest to the motor's full load current.

Automatic Protection Settings

The MCP microprocessor automatically adjusts the trip settings for both current and time to align with the start-up characteristics for the motor type selected. This includes a dampening means to accommodate a transient motor in-rush current without nuisance tripping of the circuit breaker.

Automatic Protection Settings

Manual Protection Settings

The manual settings may be adjusted to multiples of current based on the rotary switch setting for motor Full Load Amperes (FLA).

$$\text{Instantaneous Trip Point} = (FLA) \times (I_m)$$

For example, if FLA rotary switch is set to 20 and I_m rotary switch is set to 9x, then the instantaneous trip point will be 180 A.

See Additional Technical Characteristics , page 76 for more information.

MicroLogic 1.3 M Electronic Trip Units for Instantaneous Protection Only (L-Frame Circuit Breakers Only)

MicroLogic 1.3 M trip units are used in 3-device motor-feeder solutions on PowerPacT L-frame circuit breakers with performance levels G/J/L. They provide short-circuit protection for motors up to 250 kW at 400 V.

MicroLogic 1.3 M trip units provide instantaneous protection only, using electronic technology. They are dedicated to 600 A three-pole (3P 3D) circuit breakers or four-pole circuit breakers with detection on three poles (4P, 3D). They are especially used in three-pole versions for motor protection.

Circuit breakers equipped with MicroLogic 1.3 M trip units, without thermal protection, are used in certain applications to replace automatic switches. MicroLogic 1.3 M trip units are available on PowerPacT L-frame circuit breakers only.

NOTE: All MicroLogic trip units have a transparent, sealable cover that protects access to the adjustment rotary switches.

They also provide the benefits of electronic technology:

- accurate settings
- tests
- “Ready” LED.

Circuit breakers with a MicroLogic 1.3 M trip unit are combined with a overload relay and a contactor.

Protection settings are made using a rotary switch.

Protection Version

Three pole (3P): three-pole frame circuit breakers equipped with detection on all three poles.

Indications

The green “Ready” LED blinks slowly when the electronic trip unit is ready to provide protection. It indicates the trip unit is operating correctly.

NOTE: All the trip units have a transparent sealable cover that protects access to the adjustment rotary switches.

	Non-tripping time Maximum break time	0 30 ms			

141. Motor standards require operation at 104°F (40°C). Circuit breaker ratings are derated to take this requirement into account.

MicroLogic 2.2 M and 2.3 M Electronic Trip Units

MicroLogic 2.2 M and 2.3 M trip units provide built-in thermal and instantaneous protection. They are used in two-device motor-feeder solutions on PowerPacT H-, J-, and L-frame circuit breakers with performance levels J/L. They provide protection for motors up to 315 kW at 400 V against:

- short-circuits
- overloads with selection of a trip class (5, 10 or 20)
- phase unbalance.

Circuit breakers with a MicroLogic 2.2 M / 2.3 M trip unit include protection similar to an inverse-time overload relay. They are combined with a contactor.

Protection settings are made using a rotary switch.

Overloads (or Thermal Protection)

Long-time protection and trip class (FLA)

- Inverse-time thermal protection against overloads with adjustable pick-up FLA.
- Settings are made in amperes. The tripping curve for long-time protection, which indicates time delay t_r before tripping, is defined by the selected trip class.

Trip Class

The class is selected as a function of the normal motor starting time.

- Class 5: starting time less than 5 s
- Class 10: starting time less than 10 s
- Class 20: starting time less than 20 s

For a given class, all motor-feeder components must be sized to carry the 6 x FLA starting current without excessive temperature rise during the time corresponding to the class.

Short Circuits

Short-time protection (I_{sd})

- Provides protection with an adjustable pick-up I_{sd} .
- There is a very short delay to let through motor starting currents.

Non-adjustable instantaneous protection (I_i)

- Instantaneous protection with non-adjustable pick-up I_i .

Phase Unbalance or Phase Loss (I_{unbal})

This function opens the circuit breaker if a phase unbalance occurs that is greater than the 30% fixed pick-up I_{unbal} following the non-adjustable time delay t_{unbal} equal to:

- 0.7 s
- 4 s during normal operation

Phase loss is an extreme case of phase unbalance and leads to tripping under the same conditions.

Indications

Front indications

- The green “Ready” LED blinks slowly when the electronic trip unit is ready to provide protection. It indicates the trip unit is operating correctly.
- Red alarm LED for motor operation goes ON when the thermal image of the rotor and stator is greater than 95% of the permissible temperature rise.

Remote indications using SDTAM module

- PowerPacT H-, J-, and L-frame devices with a MicroLogic 2 M trip unit can be equipped with an SDTAM module dedicated to motor applications for:
 - A contact to indicate circuit-breaker overload.
 - A contact to open the contactor. In the event of a phase unbalance or overload, this output is activated 400 ms before circuit-breaker tripping to open the contactor and avoid circuit breaker tripping
- This module takes the place of the shunt trip (MN)/undervoltage trip (MX) coils and an auxiliary switch (OF) contact

SDTAM remote indication relay module with its terminal block.

NOTE: All the trip units have a transparent sealable cover that protects access to the adjustment rotary switches.

142. Motor standards require operation at 104°F (40°C). Circuit-breaker ratings are derated to take this requirement into account.

143. The unbalance measurement takes into account the most unbalanced phase with respect to the average current.

Additional Technical Characteristics

Unbalance of Phase Currents and Voltages  Motor Starting and Long Starts 	Phase unbalance	An unbalance in three-phase systems occurs when the three voltages are not equal in amplitude and/or not displaced 120° with respect to each other. It is generally due to single-phase loads that are incorrectly distributed throughout the system and unbalance the voltages between the phases. These unbalances create negative current components that cause braking torques and temperature rise in asynchronous machines, thus leading to premature aging.
	Phase loss	Phase loss is a special case of phase unbalance. - During normal operation, it produces the effects mentioned above and tripping must occur after four seconds. - During starting, the absence of a phase may cause motor reversing, i.e. it is the load that determines the direction of rotation. This requires virtually immediate tripping (0.7 seconds). Starting time in compliance with the class (MicroLogic 2 M) For normal motor starting, MicroLogic 2 M checks the conditions below with respect to the thermal-protection (long-time) pick-up FLA: - current > 10% x FLA (motor-off limit) - overrun of 1.5 x FLA threshold, then return below this threshold before the end of a 10 s time delay. If either of these conditions is not met, the thermal protection trips the device after a maximum time equal to that of the selected class. Pick-up FLA must have been set to the current indicated on the motor rating plate.
	Starting time in compliance with the class (MicroLogic 2 M)	For normal motor starting, MicroLogic 2 M checks the conditions below with respect to the thermal-protection (long-time) pick-up FLA: - current > 10% x FLA (motor-off limit) - overrun of 1.5 x FLA threshold, then return below this threshold before the end of a 10 s time delay If either of these conditions is not met, the thermal protection trips the device after a maximum time equal to that of the selected class. Pick-up FLA must have been set to the current indicated on the motor rating plate.

Energy Management

Energy Management Using the Smart System

Use the Smart System to connect your building to real savings in three steps:

1. Measure
Embedded and stand-alone metering and control
2. Connect
 - Integrated communication interfaces
 - Ready to connect to energy management platforms
3. Save
 - Data-driven energy efficiency actions
 - Real-time monitoring and control
 - Access to energy and site information through on-line services

Measure

Smart System communications mean visible information.

Grouping most of the electrical protection, command and metering components, the switchboards are now significant sources of data locally displayed and sent via communication networks.

Connect

Smart Systems use reliable, simple-to-install-and-use displays, and Ethernet and Modbus interfaces.

Information is safely transmitted through the most efficient networks:

- Modbus SL inside switchboards, between components
- Ethernet, on cable or WiFi, inside the building and connecting switchboards and computers
- Ethernet or GPRS, for access to on-line services by Schneider Electric
- Energy experts, no matter where they are located, can now provide advice based on the updated data of the building.

Save

On-Site Real-Time Monitoring

The FDM128 touch screen display connected to the Ethernet:

- shows essential electrical information and alarms concerning the electrical network
- allows control (open, close, reset) of various equipment

The FDM128 touch screen provides real-time value checking and control, directly on the front panel of the main switchboard. On a PC display with common browser:

- shows monitoring web pages hosted into the local Ethernet interface
- alarm events generate automatic email notifications
- allows control (open, close, reset) of various equipment

The data is displayed graphically or recorded into files for optimizing the use of energy in the building. As an example, the data can help validate the change of temperature settings, time scheduling in a Building Management System or other automated devices.

On-Line Energy Management Services

StruXureWare Energy Operation automates data collection using an open, scalable, and secure energy management information system.

With the help of the Schneider Electric energy management services team, data is turned into information to enable customers to understand their facilities' performance on an ongoing basis.

Energy Operation leverages companies' current investments in their existing systems, and can be used to communicate advanced results and performance to a broad audience for a shared understanding throughout an organization.

Power Meter Functions

In addition to protection functions, MicroLogic A/E trip units offer all the functions of Power Meter products as well as operating assistance for the circuit breaker.

MicroLogic A/E trip unit measurement functions are made possible by the MicroLogic trip unit's intelligence and the accuracy of the sensors. They are handled by a microprocessor that operates independent of protection functions.

Display Functions

MicroLogic Trip Unit LCD

Trip Unit LCD

The user can display all the protection settings and the main measurements on the LCD screen of the trip unit.

- MicroLogic A trip unit: instantaneous rms current measurements
- MicroLogic E trip unit: voltage, frequency and power measurements and energy metering, in addition to the measurements offered by MicroLogic A

To make the display available under all conditions and increase operating comfort, an external power supply is recommended for MicroLogic A trip unit. It is required to:

- display faults and interrupted current measurements
- use all the functions of MicroLogic E trip unit (such as metering of low power and energy values)
- ensure operation of the communication network

The external power supply can be shared by several devices. For description, see 24 Vdc Power Supply, page 122.

FDM121 Display Unit (One to One)

Display Function

The FDM121 switchboard display unit can be connected to a communication (COM) option (Breaker Communication Module [BSCM]) using a circuit breaker ULP cord to display all measurements on a screen. The LCD screen is 3.78 x 3.78 in. (96 x 96 mm). The FMD121 display unit requires a 24 Vdc power supply. The COM option (BSCM) unit is supplied by the same power supply via the circuit breaker ULP cord connecting it to the FDM121. See FDM121 Display, page 91 for more information.

FDM128 Display: Voltage

FDM128 Display: Power

FDM128 Display: Consumption

For all FDM, in addition to the information displayed on the MicroLogic trip unit LCD, the FDM screen shows demand, power quality, and maximum/minimum ammeter values along with histories and maintenance indicators.

Measurement Functions

Instantaneous RMS Measurements

Measurement Function

The MicroLogic trip unit continuously displays the RMS value of the highest current of the three phases and neutral (I_{max}). The navigation buttons can be used to scroll through the main measurements.

In the event of a fault trip, the trip cause is displayed.

The MicroLogic A trip unit measures phase, neutral, and ground fault currents.

MicroLogic E trip units offer voltage, power, frequency, and energy metering in addition to the measurements provided by MicroLogic A trip units.

Maximum / Minimum Ammeter

Every instantaneous measurement provided by MicroLogic A/E trip units can be associated with a maximum/minimum ammeter. The maximum for the highest current of the three phases, neutral, and demand current can be reset using the MicroLogic trip unit keypad, FDM display unit, or the communication system.

Energy Metering

The MicroLogic E trip units also measures the energy consumed since the last reset of the meter. The active energy meter can be reset using the MicroLogic trip unit keypad, the FDM display unit, or the communication system.

Demand and Maximum Demand Values

MicroLogic E trip units also calculate demand current and power values. These calculations can be made using a block or sliding interval that can be set from five to sixty minutes in steps of one minute. The window can be synchronised with a signal sent through the communication system. Whatever the calculation method, the calculated values can be recovered on a PC through the communication network.

Ordinary spreadsheet software can be used to provide trend curves and forecasts based on this data. They provide a basis for load shedding and reconnection operations used to adjust consumption to the subscribed power.

Power Quality

The MicroLogic E trip unit calculates power quality indicators taking into account the presence of harmonics up to the fifteenth harmonic, including the total harmonic distortion (THD) of current and voltage.

Additional Technical Characteristics

Measurement accuracy of the entire measurement system, including the sensors:

- Current: +/- 1%
- Voltage: +/- 0.5%
- Power and energy: +/- 2%
- Frequency: +/- 0.1%

148. Absolute mode: E absolute = E out + E in; Signed mode: E signed = E out - E in.

149. Available through the communication network only.

Operating-Assistance Functions Characteristics

MicroLogic Trip Unit Alarms with Time-Stamping

Alarm Types

The user can assign an alarm to all MicroLogic A or E trip unit measurements or events:

- up to 12 alarms can be used together:
- two alarms are predefined and activated automatically:
MicroLogic 5 trip unit: overload (I_r)
MicroLogic 6 trip unit: overload (I_r) and ground fault (I_g)
- thresholds, priorities and time delays can be set for ten other alarms.
- the same measurement can be used for different alarms to precisely monitor certain values, e.g. the frequency or the voltage
- alarms can also be assigned to various states: phase lead/lag, four quadrants, phase sequence selection of display priorities, with screen displaying a window showing high priority alarm
- alarm time-stamping.

Alarm Settings

Alarms cannot be set using the keypad or the front display module. They are set through the communication network with the PC. Set-up includes the threshold, priority, activation delay before display and deactivation delay. It is also possible to reprogram the standard assignment for the two SDx relay outputs to user-selected alarms.

Alarm Reading

Remote alarm indicators:

- reading on the front display module or on a PC through the communication network
- system remote indicators using SDx relay with two output contacts for alarms
- MicroLogic trip unit built-in LCD display

Histories and Event Tables

MicroLogic A and E trip unit have histories and event tables that are always active.

Three types of time-stamped histories

- Tripping due to overruns of I_r , I_{sd} , I_i , I_g : last 17 trips
- Alarms: last 10 alarms
- Operating events: last 10 events

Each history record is stored with:

- indicators in clear text in a number of user-selectable languages
- time-stamping: date and time of event
- status: pick-up / drop-out

Two types of time-stamped event tables

- Protection settings
- Minimums / maximums

Display of alarms and tables

The time-stamped history and event tables may be displayed on a PC through the communication network.

Embedded memory

MicroLogic A and E trip units have a non-volatile memory that saves all data on alarms, histories, event tables, counters and maintenance indicators even if power is lost.

Maintenance Indicators

MicroLogic A and E trip units have indicators for, among others, the number of operating cycles, contact wear and operating times (operating hours counter) of the PowerPacT H-, J-, and L-frame circuit breakers.

It is possible to assign an alarm to the operating cycle counter to plan maintenance. The various indicators can be used together with the trip histories to analyze the level of stresses the device has been subjected to. The information provided by the indicators cannot be displayed on the MicroLogic trip unit LCD. It is displayed on the PC through the communication network.

Management of Installed Devices

Each circuit breaker equipped with a MicroLogic 5 or 6 trip unit can be identified using the communication network:

- serial number
- firmware version
- hardware version
- device name assigned by the user

This information together with that previously described provides a clear view of the state of the installed devices.

NOTE: Please refer to *Display Functions*, page 81 for more details on display formats.

MicroLogic 5/6 Trip Units Operating Assistance Functions

										Type		Display

Maintenance Indicators													
Counter	Mechanical cycles ¹⁵¹ Electrical cycles ¹⁵¹ Trips Alarms Hours	Assignable to an alarm Assignable to an alarm One per type of trip One for each type of alarm Total operating time (hours)								X	X	—	150
Indicator	Contact wear	%								X	X	—	150
Load profile	Hours at different load levels	% of hours in four current ranges: 0–49% In, 50–79% In, 80–89% In and ≥ 90% In								X	X	—	150

Additional Technical Characteristics:

- **Contact wear**
Each time a PowerPacT H-, J-, or L-frame circuit breaker opens, the MicroLogic 5/6 trip unit measures the interrupted current and increments the contact-wear indicator as a function of the interrupted current, according to test results stored in memory. Breaking under normal load conditions results in a very slight increment. The indicator value may be read on the front display module. It provides an estimation of contact wear calculated on the basis of the cumulative forces affecting the circuit breaker. When the indicator reaches 80%, it is advised to replace the circuit breaker to ensure the availability of the protected equipment.

150. Available through the communication network only.

151. The Breaker Status and Control Module (Breaker Status and Control Module (BSCM) Modbus SL or ULP, page 135) is required for these functions.

- Circuit breaker load profile
MicroLogic 5/6 trip units calculate the load profile of the circuit breaker protecting a load circuit. The profile indicates the percentage of the total operating time at four current levels (% of I_n):
 - 0 to 49% I_n
 - 50 to 79% I_n
 - 80 to 89% I_n
 - $\geq 90\%$ I_n
- This information can be used to optimize use of the protected devices or to plan ahead for expansion.

Motor Circuit Protectors (AC Only)

See [Motor Circuit Protection](#), page 64 for information about PowerPacT H-, J- and L-frame electronic motor circuit protectors (MCP) with trip units:

MicroLogic 1.3 M

MicroLogic 2 M

FDM121 Display

MicroLogic trip unit measurement capabilities come into full play with the FDM121 display. It connects with a circuit breaker ULP cord and displays the MicroLogic trip unit information. The result is a true integrated unit combining a circuit breaker and a power meter. Additional operating assistance functions can also be displayed.

An FDM121 display unit can be connected to ULP communication devices using a prefabricated cord to display all measurements, alarms, histories and event tables, maintenance indicators, and management of installed devices on a screen.

The FMD121 display unit requires a 24 Vdc power supply.

The FDM121 is a display that can be integrated with the PowerPacT H/J/L/P/R or MasterPacT NW/NT circuit breaker systems. It uses the sensors and processing capacity of the MicroLogic trip unit. It is easy to use and requires no special software or settings. It is immediately operational when connected to the circuit breaker by a ULP cord.

It also provides monitoring and control with the use of the I/O application module, the motor mechanism module, or the circuit breaker communication module.

The FDM121 has a large display, but requires very little depth. The anti-glare graphic screen is backlit for very easy reading even under poor ambient lighting and at sharp angles.

Display of MicroLogic Trip Unit Measurements and Alarms

The FDM121 is intended to display MicroLogic trip unit measurements, alarms and operating information. It cannot be used to modify the protection settings.

Measurements can be easily accessed using a menu. All user-defined alarms are automatically displayed. The display mode depends on the priority level selected during alarm set-up:

- high priority: a pop-up window displays the time-stamped description of the alarm and the orange Alarm LED flashes;
- medium priority: the orange Alarm LED goes continuously on;
- low priority: no display on the screen.

All detected faults resulting in a trip automatically produce a high-priority alarm, without any special settings required. In all cases, the alarm history is updated. The MicroLogic trip unit saves the information in its non-volatile memory in the event of an FDM121 power loss.

Status Indications and Remote Control

FDM121 Display

Surface Mount Accessory

When the circuit breaker is equipped with the Breaker Communications Module (BSCM), the FDM121 display can also be used to view circuit breaker status conditions:

- O/F: ON/OFF
- SD: trip indication
- SDE: fault-trip indication (overload, short-circuit, or ground fault).

When the circuit breaker system is equipped with the I/O application module, the FDM121 can monitor and control:

- cradle management
- circuit breaker operation
- light and load control
- custom applications.

When the circuit breaker is equipped with the communication motor operator etc., the FDM121 display can also be used to control (open/close) the circuit breaker.

Two operating mode are available:

- local mode: open/close commands are enabled from the FDM121 while disabled from the communication network;
- remote mode: open/close commands are disabled from the FDM121 while enabled from the communication network.

Main Characteristics

Connection with FDM121 Display Unit

- A 3.78 x 3.78 x 1.18 in. (96 x 96 x 30 mm) screen requiring 0.39 in. (10 mm) behind the door (or 0.79 in. [20 mm] when the 24 V power supply connector is used)
- White backlighting
- Wide viewing angle: vertical $\pm 60^\circ$, horizontal $\pm 30^\circ$
- High resolution: excellent reading of graphic symbols
- Alarm LED: flashing orange for alarm pick-up, steady orange after operator reset if the alarm condition persists
- Operating temperature range: $+14^\circ\text{F}$ (-10°C) to $+131^\circ\text{F}$ ($+55^\circ\text{C}$)
- CE / UL / CSA marking
- 24 Vdc power supply, with tolerances: 24 V -20% (19.2 V) to 24 V +10% (26.4 V)

When the FDM121 is connected to the communication network, the 24 Vdc can be supplied by the communication system wiring system. Consumption is 40 mA.

Mounting

The FDM121 is easily installed in a switchboard.

- Standard door cut-out is 3.6 x 3.6 in. (92 x 92 mm).
- Attached using clips.

To avoid a cut-out in the door, an accessory is available for surface mounting by drilling only two 0.87 in. (22 mm) diameter holes.

Connection

The FDM121 is equipped with a 24 Vdc terminal block:

- A plug-in type terminal block with two wire inputs per point for easy daisy-chaining.
- A power supply range of 24 Vdc -20% (19.2 V) to 24 Vdc +10% (26.4 V).
A 24 Vdc type auxiliary power supply must be connected to a single point on the ULP system. The FDM121 display has a two-point screw connector on the rear panel of the module for this purpose. The ULP module to which the auxiliary power supply is connected distributes the supply via the ULP cable to all the ULP modules connected to the system and therefore also to MicroLogic trip unit. See wiring diagram later in this section.
- Two RJ45 jacks.

The MicroLogic trip unit connects to the internal communication terminal block on the PowerPacT or ComPacT circuit breaker with the circuit breaker ULP cord. Connection to one of the RJ45 connectors on the FDM121 automatically establishes communication between the MicroLogic trip unit and the FDM121 and supplies power to the MicroLogic trip unit measurement functions. When the second connector is not used, it must be fitted with a line terminator.

Navigation

Five buttons are used for intuitive and fast navigation. The “Context” button may be used to select the type of display (digital, bar graph, analog). The user can select the display language (Chinese, English, French, German, Italian, Portuguese, Spanish, etc.).

Product Identification

Metering: Submenu

Metering: Meter

Services

Screens

Main Menu

When powered up, the FDM121 screen automatically displays the ON/OFF status of the device.

Quick View

Metering

Control

Alarms

Services

When not in use, the screen is not backlit. Backlighting can be activated by pressing one of the buttons. It goes off after three minutes.

Access to Essential Information

- “Quick view” provides access to five screens that display a summary of essential operating information (I, U-V, f, P, E, THD, circuit breaker ON/OFF).

Access to Detailed Information

- “Metering” can be used to display the measurement data (I, U-V, f, P, Q, S, E, THD, PF) with the corresponding min/max values.
- “Alarms” displays active alarms and the alarm history.
- “Services” provides access to the operation counters, energy and maximum ammeter reset function, maintenance indicators, identification of modules connected to the internal bus, and FDM121 internal settings (language, contrast, etc.).

Communication Components and FDM121 Connections

The FDM121 degree of protection is IP54 in front. IP54 is maintained after switchboard mounting by using the supplied gasket during installation.

FDM121 Connections

Connections

PowerPacT circuit breaker is connected to the I/O module or FDM121 display unit via the internal terminal block for the NSX cord equipped with an RJ45 connector:

- Cord is available in three lengths: 0.98 ft. (0.35 m), 4.3 ft. (1.3 m) and 9.8 ft. (3 m).
- Lengths up to 32.9 ft. (10 m) are possible using extensions.

The FDM121 display unit and the I/O module are connected to:

- the IFM Modbus interface by a communication cable with RJ45 connectors on both ends or
- the IFE Ethernet interface module by a communication cable with RJ45 connectors on both ends.

- A. Modbus Network
- B. Modbus Interface
 - B1: IFM Modbus Interface
 - B2: IFE Modbus Interface
- C. NSX Cord
- D. Internal Terminal Block for Communication via NSX Cord
- E. BSCM Module
- F. Prefabricated wiring
- G. MicroLogic Trip Unit

Communication Components and Connections, IFE

FDM128 Display

The MicroLogic trip unit measurement capabilities are fully utilized with the FDM128 display. The FDM128 display connects to Ethernet communication using the RJ45 port and displays MicroLogic trip unit information. The result is an integrated unit combining a circuit breaker with a power meter. Additional operating assistance functions can also be displayed.

The FDM128 display unit can be connected to a MicroLogic COM option (BSCM). It uses the sensors and processing capacity of the MicroLogic trip unit and requires no special software or settings. The FDM128 is a large display, but requires very little depth. The anti-glare graphic screen is backlit for easy reading even under poor ambient lighting and at sharp angles.

The FDM128 display is designed to manage up to eight devices (PowerPacT H/J/L/P/R or MasterPacT NW/NT circuit breakers).

Display of MicroLogic Trip Unit Measurements and Trips

The FDM128 is intended to display MicroLogic 5/6 trip unit measurements, trips, and operating information. It cannot be used to modify the protection settings.

- Measurements may be easily accessed using a menu.
- Trips are automatically displayed.
- A pop-up window displays the time-stamped description of the trip.

Status Indications

When the circuit breaker is equipped with the COM option (BSCM) (including its set of sensors) the FDM128 display can also be used to view circuit breaker status conditions:

- O/F: ON/OFF
- SDE: Fault-trip indication (overload, short-circuit, ground fault)
- CE, CD, CT cradle management with I/O application module.

Remote Control

When the circuit breaker is equipped with the COM option (BSCM) (including connection to a communicating motor operator), the FDM128 display can also be used to operate (open/close) the circuit breaker.

Two operating mode are available:

- Local mode: open/close commands are enabled from the FDM128 while disabled from the communication network.
- Remote mode: open/close commands are disabled from the FDM128 while enabled from the communication network.

Main Characteristics

FDM128 Display

- 4.54 x 3.40 in. (115.2 x 86.4 mm) with 5.7 in. (145 mm) QVGA display 320 x 240 pixels.
- Color TFT LCD, with LED backlight.
- Wide viewing angle: vertical $\pm 80^\circ$, horizontal $\pm 70^\circ$.
- High resolution: excellent reading of graphic symbols.
- Operating temperature range: $+14^\circ\text{F}$ (-10°C) to $+131^\circ\text{F}$ ($+55^\circ\text{C}$).
- CE / UL / CSA marking.
- 24 Vdc power supply, -10%/+20% (limit 20.4 - 28.8 Vdc).
- Consumption 6.8 W.

Mounting

Surface Mount Accessory

The FDM128 is easily installed in a switchboard.

- Standard door hole $\varnothing$ 0.87 in. (22 mm).
- The FDM128 degree of protection is IP65 at the touch screen cover. IP54 is maintained after installation by using the supplied gasket.

Connection

Connection with Display Unit

The FDM128 is equipped with:

- a 24 Vdc terminal block:
 - with a power supply range of 24 Vdc (limit 20.4 - 28.8 Vdc).
 - secures to the FDM128 display unit using a 2-point screw connector on the rear panel of the module.
- one RJ45 Ethernet jack.

The MicroLogic trip unit connects to the internal communication terminal block on the PowerPacT circuit breakers through the circuit breaker ULP cord and Ethernet connection through the IFE.

Navigation

- A touch screen is used for intuitive and fast navigation.
- The user can select the display language (Chinese, English, French, German, Italian, Portuguese, Spanish, etc.).

Trip Units

Available Trip Units

PowerPacT H-, J-, and L-frame circuit breakers offer a range of thermal-magnetic and MicroLogic electronic trip units in interchangeable cases. Thermal-magnetic trip units are designed to open automatically under overload or short circuit. H-frame and J-frame thermal-magnetic circuit breakers contain individual thermal (overload) and instantaneous (short circuit) sensing elements in each pole.

MicroLogic electronic trip units provide intelligent operation, with wide setting ranges make installation upgrades easier. Designed with processing capabilities, MicroLogic trip units can provide measurement information and device operating assistance to supply all of the information required to manage the electrical installation and optimize energy use.

MicroLogic trip units offer excellent measurement accuracy, using a new generation of current transformers combining “iron-core” sensors for self-powered electronics and “air-core” sensors (Rogowski coils) for measurements. The protection functions are managed by an ASIC component that is independent of the measurement functions. This independence ensures immunity to conducted and radiated disturbances and a high level of reliability.

An LED on the front of the electronic trip unit indicates the result of the self-test running continuously on the measurement system and the tripping release. When the green LED is flashing, the links between the CTs, the processing electronics and the Mitop release are operational. The circuit breaker is ready to protect. A minimum current of 15 to 50 A, depending on the device, is required for this function.

The dual adjustment for protection functions on MicroLogic 5/6 consists of:
— an adjustment using rotary switches to set the maximum value
— an adjustment using the keypad or remote controls to fine-tune the setting. This setting may not exceed the first one. It can be read directly on the MicroLogic screen, to within one ampere and a fraction of a second.

NOTE: All the trip units have a transparent sealable cover that protects access to the adjustment rotary switches.

For MicroLogic trip unit features, see PowerPacT H-, J-, and L-frame Circuit Breaker Trip Units, page 31.

Understanding the Names of MicroLogic Electronic Trip Units

Protection	Frame	Measurements	Applications
1: I 3: LI or LSI 5: LSI 6: LSIG	H- and J-frame	A: Ammeter 	Distribution or M: Motors
L: Long time S: Short time I: Instantaneous G: Ground fault	L-frame	E: Energy 	

Example Trip Unit Names

MicroLogic 1.3 M Trip Unit	Instantaneous only	400 or 600 A	Motor
MicroLogic 3.3 Trip Unit	LI	250, 400, or 600 A	Distribution
MicroLogic 3.2S Trip Unit	LSI	60, 100, 150, or 250 A	Distribution
MicroLogic 5.2A Trip Unit	LSI—Ammeter	60, 100, 150, or 250 A	Distribution

I_r = long-time pickup

The current level at which the circuit breaker long-time delay function begins timing.

t_r = long-time delay

The length of time the circuit breaker will carry a sustained overcurrent (greater than the long-time pickup) before initiating a trip signal.

I_{sd} = short-time pickup

The current level at which the circuit breaker short-time delay function begins timing.

t_{sd} = short-time delay

The length of time the circuit breaker will carry a short circuit (current greater than the short-time pickup) before initiating a trip signal.

I_i = instantaneous pickup

The current level at which the circuit breaker will trip with no intentional time delay.

I_g = ground-fault pickup

The level of ground-fault current at which the trip system begins timing.

Trip Unit Availability

MicroLogic 3 Trip Units

MicroLogic 3 trip units can be used on PowerPacT H-, J-, and L-Frame circuit breakers with performance levels D/G/J/L.

They provide:

- standard protection of distribution cables
- indication of:
 - overloads (using LEDs)
 - overload tripping (using the SDx relay module)

Circuit breakers equipped with MicroLogic 3 trip units can be used to protect distribution systems supplied by transformers.

Protection

Settings are made using the adjustment rotary switches.

Overloads: Long time protection (I_r)

Inverse time protection against overloads with an adjustable current pick-up I_r set using a rotary switch and an adjustable time delay t_r.

Neutral protection

- On three-pole L-frame circuit breakers, neutral protection is not possible.
- On four-pole L-frame circuit breakers, neutral protection may be set using a three-position switch:
 - switch position 4P 3D: neutral unprotected
 - switch position 4P 3D + N/2: neutral protection at half the value of the phase pick-up, (0.5 x I_r)
 - switch position 4P 4D: neutral fully protected at I_r

Front indicators

- The green “Ready” LED blinks slowly when the electronic trip unit is ready to provide protection. It indicates the trip unit is operating correctly.
- Overload pre-alarm LED: steady on when I > 90% I_r
- Overload LED: steady on when I > 105% I_r

Remote indicators

An overload trip signal can be remotely checked by installing an SDx relay module inside the circuit breaker. This module receives the signal from the MicroLogic electronic trip unit through an optical link and makes it available on the terminal block. The signal is cleared when the circuit breaker is reclosed. See SDx Module, page 152.

SDx Module

MicroLogic 5/6 A or E Trip Units

MicroLogic 5/6 A (Ammeter) or E (Energy) trip units can be used on PowerPacT H-, J-, and L-frame circuit breakers with performance levels D, G, J, or L. They all have a front display module. They offer basic LSI protection (MicroLogic 5 trip unit) or LSI and ground-fault protection G (MicroLogic 6 trip unit). They also offer measurement, alarm and energy values.

The capabilities of MicroLogic 5/6 A and E trip units come into full play with the front display module. When the two are connected using a simple cable with RJ45 connectors, the combination offers full Power Meter capabilities and all the measurements required to monitor the electrical installation.

MicroLogic 5/6 A or E Trip Units

Trip Unit	Measurements	Operating and Maintenance Assistance	Communication Network
Ammeter (MicroLogic A Trip Unit)	Current measurements - Phase and neutral currents IA, IB, IC, IN - Average current of the 3 phases Iavg - Highest current of the three phases Imax - Ground-fault current Ig (MicroLogic 6.2 / 6.3 A) trip units - Maximum and minimum current measured	Indicators, alarms and histories - Fault types - Alarms for high/low alarm thresholds linked to I measurements - Trip, alarm and operating histories - Time-stamped tables for settings and maximum current Maintenance indicators - Operation, trip and alarm counters - Operating hours counter - Contact wear - Load profile and thermal image	Modbus with add-on module
Energy (MicroLogic E Trip Unit)	Current measurements - Phase and neutral currents IA, IB, IC, IN - Average current of the 3 phases Iavg - Highest current of the three phases Imax - Ground-fault current Ig (MicroLogic 6.2 / 6.3 A trip units) - Maximum and minimum current measured - Current unbalance between phases Voltage measurements - Phase-to-phase (V) and phase-to-neutral (U) voltages - Average voltages Vavg, Uavg - Ph-Ph (V) and Ph-N (U) voltage unbalance Frequency measurements - Frequency (f) Power-quality indicators - Total harmonic distortion (THD) for current and voltage Power measurements - Active, reactive and apparent power, total and per phase - Power factor and cos φ Maximum and minimum - For all I, V, f, P, E measurements Demand current and power measurements - Demand values, total and per phase - Maximum demand Energy metering - Active, reactive and apparent energy, total and per phase	Indicators, alarms and histories - Fault types - Alarms for high/low thresholds linked to I, V, f, P, E measurements - Trip, alarm and operating histories - Time-stamped tables for settings and I, V, f, P, E maximum values Maintenance indicators - Operation, trip and alarm counters - Operating hours counter - Contact wear - Load profile and thermal image	Modbus with add-on module

Power Requirements

The amount of current needed to power the trip unit is printed in the upper left hand corner of the trip unit by the Ready LED.

Trip Unit Power Requirements

Frame		Power-Up Requirement
H-Frame, 60 A	60 A	>15 A
	100 A	>15 A
	150 A	>30 A
J-Frame, 250 A	250 A	>30 A
L-Frame, 600 A	400 A	>50 A
	600 A	>50 A

Protection

Settings can be adjusted in two ways, using the rotary switches and/or the keypad.

- The keypad can be used to make fine adjustments in 1 A steps below the maximum value defined by the setting on the rotary switch.
- Access to setting modifications using the keypad is protected by a locking function displayed on the screen and controlled by a microswitch.
- The lock is activated automatically if the keypad is not used for 5 minutes.
- Access to the microswitch is protected by a transparent, sealable cover.
- With the cover closed, it is still possible to display the various settings and measurements using the keypad.

Overloads: Long-Time Protection (I_r)

Inverse time protection against overloads with an adjustable current pick-up I_r is set using a rotary switch or the keypad for fine adjustments. The time delay t_r is set using the keypad.

Short-Circuits: Short-Time Protection (I_{sd})

Short-circuit protection with an adjustable pick-up I_{sd} and adjustable time delay t_{sd} , with the possibility of including a portion of an inverse time curve (I^2t On).

Short-Circuits: Instantaneous Protection (I_i)

Instantaneous protection with adjustable pick-up I_i .

Additional Ground Fault Protection (I_g) on MicroLogic 6 Trip Units

Residual type ground-fault protection with an adjustable pick-up I_g and adjustable time delay t_g . Possibility of including a portion of an inverse time curve (I^2t On).

Neutral Protection

- On four-pole circuit breakers, this protection can be set using the keypad:
 - Off: neutral unprotected
 - 0.5: neutral protection at half the value of the phase pick-up ($0.5 \times I_r$)
 - 1.0: neutral fully protected at I_r
 - OSN: Oversized neutral protection at 1.6 times the value of the phase pick-up. Used when there is a high level of 3rd order harmonics (or orders that are multiples of 3) that accumulate in the neutral and create a high current. In this case, the device must be limited to $I_r = 0.63 \times I_n$ for the maximum neutral protection setting of $1.6 \times I_r$.

- With three-pole circuit breakers, the neutral can be protected by installing an external neutral sensor with the output (T1, T2) connected to the trip unit.

Zone Selective Interlocking (ZSI)

A ZSI terminal block may be used to interconnect a number of MicroLogic trip units to provide zone selective interlocking for short-time (I_{sd}) and ground-fault (I_g) protection, without a time delay. For PowerPacT H- and J-frame circuit breakers, the ZSI function is available only in relation to the upstream circuit breaker (ZSI out). For PowerPacT L-frame circuit breakers, the ZSI function is available in relation to the upstream circuit breaker (ZSI out) and downstream circuit breakers (ZSI in).

Display of Type of Fault

Display of Interrupted Current

On a fault trip, the type of fault (I_r , I_{sd} , I_i , I_g), the phase concerned and the interrupted current are displayed. An external power supply is required.

Indicators

Front Indicators

- The green "Ready" LED blinks slowly when the electronic trip unit is ready to provide protection. It indicates the trip unit is operating correctly.
- Orange overload pre-alarm LED stays on when $I > 90\% I_r$
- Red overload LED stays on when $I > 105\% I_r$

Remote Indicators

An SDx relay module installed inside the circuit breaker can be used to remote the following information:

- overload trip
- overload prealarm (MicroLogic 5 trip units) or ground fault trip (MicroLogic 6 trip units)

This module receives the signal from the MicroLogic electronic trip unit through an optical link and makes it available on the terminal block. The signal is cleared when the circuit breaker is closed.

Note: all the trip units have a transparent sealable cover.

These outputs can be reprogrammed to be assigned to other types of tripping or that protects access to the adjustment rotary switch. The module is described in detail in the section dealing with accessories.

Smart System Communication Wiring System

Wiring System ULP

The wiring system is designed for low-voltage power switchboards. Installation does not require special tools or training. The prefabricated wiring ensures both data transmission (Modbus protocol) and 24 Vdc power distribution for the communications modules on the MicroLogic trip units.

Four Functional Levels

All PowerPacT H-, J-, and L-frame circuit breakers devices can be equipped with the communication function using a pre-wired connection system and a Modbus communication interface module. The interface module can be connected directly or through the front display module (FDM121).

The PowerPacT H-, J-, and L-frame circuit breakers can be integrated in a Modbus communication network. Four functional levels can be used separately or combined to adapt to all supervision requirements.

Level	Function
Communication of status indications	Compatible with PowerPacT H-, J- and L-frame circuit breakers and automatic switches. Use the BSCM module to access the following information: • ON/OFF position • trip indication • fault-trip indication
Communication of commands	Available on all circuit breakers and automatic switches with communicating motor operators, the remote control can be used to: • open • closed • reset
Communication of measurements with MicroLogic 5/6 A or E trip unit	This level provides access to: • instantaneous and demand values • maximums/minimums • energy metering • demand current and power • power quality
Communication of operating assistance with MicroLogic 5/6 A or E trip unit	This level also provides access to: • protection and alarm settings • time-stamped histories and event tables • maintenance indicators

Modbus Principle

The Modbus RS 485 (RTU protocol) system is an open bus on which communicating Modbus devices (PowerPacT and MasterPacT circuit breakers, Power Meter PM700, PM800, etc.) are installed. All types of PLCs and microcomputers may be connected to the bus.

Number of Devices

The maximum number of devices that may be connected to the Modbus bus depends on the type of device (PowerPacT circuit breaker with Modbus COM, PM700, PM800, MasterPacT circuit breaker, etc.), the baud rate (19200 is recommended), the volume of data exchanged and the desired response time. The RS 485 physical layer offers up to thirty-two connection points on the bus (one client, thirty-one servers).

Length of Bus

The maximum recommended length for the Modbus bus is 3940 feet (1200 meters).

Bus Power Source

A 24 Vdc power supply is required (less than 20% ripple, insulation class II).

Ethernet Principle

Ethernet is a data link and physical layer protocol defined by IEEE 802.10 and 100 Mbps specifications that connects computer or other Ethernet devices. Ethernet is an asynchronous Carrier Sense Multiple Access with Collision detection (referred as CSMA/CD) protocol. Carrier Sense means that the hosts can detect whether the medium (coaxial cable) is idle or busy.

Multiple Access means that multiple hosts can be connected to the common medium. Collision Detection means a host detects whether its transmission has collided with the transmission of another host (or hosts).

IFE Ethernet interface can be connected to a PC or a laptop over Ethernet. The maximum length of Ethernet cable is 325 feet (100 meters). IFE Ethernet interface + gateway provides a Modbus TCP/IP gateway over Ethernet to enable Modbus TCP communication from a Modbus TCP client to any Modbus server devices connected to it. The maximum number of active TCP client connections is twelve.

IFE Ethernet interface has an embedded web server (web page).

IFE Ethernet Interface

IFE Interface, IFE Interface + Gateway Description

IFE Interface

IFE Interface + Gateway

Introduction

The IFE interface and IFE interface + gateway enable low-voltage circuit breakers such as MasterPacT and PowerPacT to be connected to an Ethernet network.

IFE Interface

Provides Ethernet access to a single low-voltage circuit breaker.

Function: Interface - one circuit breaker is connected to the IFE interface using its ULP port.

IFE Interface + Gateway

Provides Ethernet access to one or several low-voltage circuit breakers.

Functions:

- Interface - one circuit breaker is connected to the IFE interface using its ULP port.
- Gateway: several circuit breakers on a Modbus network are connected using the IFE interface + gateway client Modbus port.

IFE Interface, IFE Interface + Gateway Features

- Dual 10/100 Mbps Ethernet port for simple daisy chain connection.
- Device profile web service for discovery of the IFE interface, IFE interface + gateway on the LAN.
- Ethernet interface for MasterPacT and PowerPacT circuit breakers.
- Gateway for Modbus-SL connected devices (IFE interface + gateway only).
- Embedded set-up web pages.
- Embedded monitoring web pages.
- Embedded control web pages.
- Built-in e-mail alarm notification.

IFE Interface, IFE Interface + Gateway Screen

Mounting

The IFE interface and IFE interface + gateway are DIN rail mounting devices. A stacking accessory enables the user to connect several IFMs (ULP to Modbus interfaces) to an IFE interface + gateway without additional wiring.

24 Vdc Power Supply

The IFE interface and the IFE interface + gateway must always be supplied with 24 Vdc.

The IFMs stacked to an IFE interface + gateway have power supplied by the IFE interface + gateway, thus it is not necessary to supply them separately. It is recommended to use a UL listed and recognized limited voltage/limited current or a class 2 power supply with a 24 Vdc, 3 A maximum.

Required Circuit Breaker Communication Modules

The connection to an IFE interface or IFE interface + gateway requires a communication module embedded into the circuit breaker:

- PowerPacT and ComPacT (fixed or drawout) circuit breakers: BSCM communication module
- Drawout PowerPacT and ComPacT circuit breakers: BSCM and its respective I/O (Input/Output) application module.

All connection configurations for PowerPacT and ComPacT circuit breakers require the circuit breaker ULP cord. The insulated NSX cord is mandatory for system voltages greater than 480 Vac. When the second ULP RJ45 connector is not used, it must be closed with a ULP terminator (TRV00880).

Network Communication Interface

Characteristic		Value
Type of interface module		Modbus RTU, RS485 serial connection Modbus TCP/IP Ethernet
Transmission	Modbus RS485	• Transfer rate: 9,600–19,200 Baud • Medium Double shielded twisted pair • Impedance 120 Ω
	Ethernet	Transfer rate: 10/100 Mbps Medium STP, Cat5e, straight cable
Structure	Type	Modbus, Ethernet

IFE Ethernet Interface—General Characteristics

Environmental Characteristics	
Conforming to standards	UL 508, UL 60950, IEC 60950, 60947-6-2
Certification	cUIUs, FCC, CE
Ambient temperature	Storage: -40 to +185°F (-40 to +85°C) Operation: -13 to +158°F (-25 to +70°C)
Protective treatment	ULVO, conforming to IEC 60068-2-30
Pollution	Level 3
Mechanical Characteristics	
Shock resistance	Conforming to IEC 60068-2-27 15g/11ms, 1/2 sinusoidal
Resistance to sinusoidal vibrations	Conforming to IEC 60068-2-6
Electrical Characteristics	
Power supply	24 Vdc, -20%/+10% (19.2 to 26.4 Vdc)
Consumption	Typical: 4 Vdc, 120 mA at 68°F (20°C) Maximum with gateway: 26.4 Vdc, 3 A at 140°F (60°C)
Physical Characteristics	
Dimensions	2.83 x 4.13 x 2.79 in. (72 x 105 x 71 mm)
Mounting	Mounting DIN rail

IFE Ethernet Interface—General Characteristics (Continued)

Weight	182.5 g (0.41 lb)
Degree of protection of the installed module	On the front panel (wall mounted enclosure): IP4x Connectors: IP2x Other parts: IP3x
Connections	Screw type terminal blocks
Technical Characteristics - 24 Vdc Power Supply	
Power supply type	Regulated switch type
Rated power	72 W
Input voltage	100–120 Vac for single phase 200–500 Vac phase-to-phase
PFC filter	With IEC 61000-3-2
Output voltage	24 Vdc
Power supply out current	3:00 AM

IFM Modbus Communication Interface

Function

IFM Modbus
Communication Interface.
Ref.: TRV00210

An IFM Modbus communication interface is required for connection of a MasterPacT or PowerPacT circuit breaker to a Modbus network as long as this circuit breaker is provided with a ULP (Universal Logic Plug) port. The port is available on the BSCM.

Once connected, the circuit breaker is considered as a server by the Modbus client. Its electrical values, alarm status, open/close signals can be monitored or controlled by a Programmable Logic Controller or any other system.

Characteristics

ULP Port

Two RJ45 sockets, internal parallel wiring.

- Connection of a single circuit breaker.
- A ULP line terminator or an FDM121 display unit must be connected to the second RJ45 ULP socket.
- The RJ45 sockets deliver a 24 Vdc supply fed from the Modbus socket.
- Built-in test function, for checking the correct connection to the circuit breaker and FDM121 display unit.

Modbus Server Port

- Top socket for screw-clamp connector, providing terminals for:
 - 24 Vdc input supply (0 V, +24 V)
 - Modbus line (D1, D2, Gnd) 2-wire Modbus system.
- Lateral socket, for DIN-rail stackable connector. Both top and lateral sockets are internally parallel wired.
- Multiple IFMs can be stacked, thus sharing a common power supply and Modbus line without individual wiring.
- On the front face:
 - Modbus address setting (1 to 99): 2 coded rotary switches
 - Modbus locking pad: enables or disable the circuit breaker remote control and modification of IFM parameters.
- Self-adjusting communication format (Baud rate, parity).

- A. Modbus Screw Clamp Connector
- B. Modbus Address Switches
- C. Modbus Traffic LED
- D. Modbus Locking Pad
- E. ULP Activity LED
- F. Test Button
- G. Mechanical Lock
- H. ULP RJ45 Connectors
- I. Stacking Accessory Connection

I/O Application Module

Description

I/O Application Module

The I/O (Input/Output) application module for a low-voltage circuit breaker is part of an ULP system with built-in functions and applications to enhance the application needs. The ULP system architecture can be built without any restrictions using the wide range of circuit breakers.

The I/O application module is compliant with the ULP system specifications.

Two I/O application modules can be connected in the same ULP network.

The ranges of low-voltage circuit breakers enhanced by the I/O application module are:

- MasterPacT NW
- MasterPacT NT
- PowerPacT R-Frame
- PowerPacT P-Frame
- PowerPacT H-Frame
- PowerPacT J-Frame
- PowerPacT L-Frame

I/O (Input/Output) Application Module for Low-Voltage Circuit Breaker

The I/O application module resources are:

- Six digital inputs that are self powered for either NO and NC dry contact or pulse counter.
- Three digital outputs that are a bistable relay (5 A maximum).
- One analog input for PT100 temperature sensor.

Pre-Defined Application

The pre-defined application adds new functions to the I/O application module by:

- Selection by the application rotary switch on the I/O application module, defining the application with pre-defined input/output assignment and wiring diagram.
- No additional setting with the customer engineering tool required.

The resources not assigned to the pre-defined application are free for additional user-defined applications:

- cradle management
- circuit breaker operation
- cradle management + ERMS (Energy Reduction Maintenance Setting)

NOTE: Use only MicroLogic P or H trip units with the blue ERMS label for energy reduction maintenance setting systems. Review the I/O module user guide 0613IB1317 and ERMS installation instructions NHA37346 for details on installation, testing, and operation of the ERMS system.

- light and load control

- custom

User-Defined Applications

User-defined applications are processed by the I/O application module in addition to the pre-defined application selected.

The user-defined applications are available depending on:

- the pre-defined application selected
- the I/O application module resources (inputs and outputs) not used by the application.

The resources required by user-defined applications are assigned using the customer engineering tool:

- protection
- control
- energy management
- monitoring.

Mounting

The I/O application module is a DIN rail mounted device. Install on a steel DIN rail that is properly grounded near the device.

Application Rotary Switch

The application rotary switch enables the selection of the pre-defined application. It has nine positions and each position is assigned to a pre-defined application. The factory set position of the switch is pre-defined application one.

Setting Locking Pad

The setting locking pad on the front panel of the I/O application module enables the setting of the I/O application module by the customer engineering tool.

I/O Module Characteristics

I/O Module Characteristics

	General Characteristics		
	Environmental Characteristics	Conforming to standards	UL 508, UL 60950, IED 60950, 60947-6-2
		Certification	cULus, EAC, FCC, CE
		Ambient temperature	Storage: -40 to +185°F (-40 to +85°C) Operation: -13 to +158°F (-25 to +70°C)
		Protective Treatment	ULVO, conforming to IEC 60068-2-30
		Pollution	Level 3
	Mechanical Characteristics	Shock resistance	Conforming to IEC 60068-2-27 15g/11ms, 1/2 sinusoidal
		Resistance to sinusoidal vibrations	Conforming to IEC 60068-2-6
	Electrical Characteristics	Power Supply	24 Vdc, -20%/+10% (19.2 to 26.4 Vdc)
		Consumption	Typical: 24 Vdc, 165 mA at 20°C Maximum with gateway: 26.4 Vdc, 420 mA at 60°C
Physical Characteristics	Dimensions	2.83 x 4.52 X 2.79 in. (72 x 115 x 71 mm)	
	Mounting	DIN rail	
	Weight	0.51 lb. (229.5 g)	
	Degree of protection of the installed I/O application module	On the front panel (wall mounted enclosure): IP4x I/O parts: IP3x Connectors: IP2x	
	Connections	Screw type terminal blocks	
Technical Characteristics 24 Vdc power supply (A)	Power supply type	Regulated switch type	
	Rated power	72 W	
	Input voltage	100–120 Vac for single phase 200–500 Vac phase-to-phase maximum	
	PFC filter	With IEC 61000-3-2	
	Output voltage	24 Vdc	
	Power supply out current	3 A	
	NOTE: It is recommended to use a UL Listed / UL Recognized limited voltage / limited current or a class 2 power supply with a 24 Vdc, 3 A maximum.		
A. 24 Vdc power supply terminal block B. Digital input terminal block: • 6 inputs, 3 commons and 1 shield C. 6 input status LEDs D. Analog input status LED E. 3 output status LEDs F. EcoStruxure™ Power Commission Software

Introduction

EcoStruxure Power Commission is an intuitive, feature-rich tool that can help electrical professionals more effectively and efficiently setup, test and report, commission, and maintain MV/LV circuit breakers and digital switchboards. EcoStruxure Power Commission helps you avoid errors and rework while simplifying your workload. Intuitive, browser-based, you can become proficient with it quickly.

Compatible Devices (Configuration and Device Management)

The software is compatible with a wide range of devices including:

Low Voltage Circuit Breakers:

- ComPacT NSX/NSXm
- MasterPacT NT/NW
- MasterPacT MTZ (IEC and UL)
- PowerPacT
- TeSys GV4PB
- TeSys GV4PEM

Medium Voltage Circuit Breakers

- BM100
- PTM100
- EvoPacT

Download the software from our website: [EcoStruxure Power Commission](https://www.se.com/us/en/product-range/62980-ecostruxure-power-commission/#overview)

<https://www.se.com/us/en/product-range/62980-ecostruxure-power-commission/#overview>

Features

Most of EPC's features are free to use. The tool provides even more value with the Circuit Breaker Advanced Testing or Switchboard Advanced Commissioning Efficiency modules, which are both accessible through a paid subscription.

With EcoStruxure Power Commission, users can:

- Discover all connected devices in the electrical panel.
- Confirm electrical settings and upgrade firmware for power meters and gateways.
- Test the communication wiring, troubleshoot issues, and generate reports as part of the Factory Acceptance Tests (FAT) or Site Acceptance Tests (SAT).
- Use batch operations feature to speed up settings configuration for several devices at the same time (in-app purchase).
- Discover all circuit breakers in the electrical panel.
- Confirm electrical settings and upgrade firmware for all LV circuit breakers.
- Test and report on low-voltage circuit breakers and their trip curve behavior during installation and maintenance and generate a report (in-app purchase).
- Routine checks.
- Secondary injection testing.

- Preparation for primary injection testing.
- Zone selective interlocking testing.
- Create unique QR codes that identify each switchboard and its installed assets, which enables traceability for product upgrades, recalls, inventory audits, etc.
- Provide digitized project documentation for your customers retrievable via the switchboard QR code for fast, efficient, and paperless project handover and reference.

Accessories for MicroLogic Trip Units

NSX Cord

MicroLogic trip units are connected to the Modbus communication interface module (IFM) or front display module through the internal terminal block for the NSX cord equipped with an RJ45 connector.

The NSX cord is available in two cable lengths:

- 4.27 ft. (1.3 m)
- 9.84 ft. (3 m)

Lengths up to 32.8 ft. (10 m) are possible using extensions.

- For voltage $V \leq 480$ V, available in 3 prefabricated lengths: 0.35 m, 1.3 m and 3 m.
- For voltages $V > 480$ V, a special 1.3 m cable with an insulation accessory is required.
- A set of cables with RJ45 connectors is available to adapt to different distances between devices.

NSX Cord Catalog Numbers

Description	Catalog No.
NSX Cord 4.27 ft. (1.3 m), $V \leq 480$ V	S434201
NSX Cord 9.84 ft. (3 m), $V \leq 480$ V	S434202
NSX Cord 4.27 ft. (1.3 m), $V > 480$ V	S434204
NSX Cord 9.84 ft. (3 m), $V > 480$ V	S434303

Modbus Serial Cord Catalog Numbers

Modbus SL Cord 0.35m for $V \leq 480$ Vac ¹⁵⁹	S434221

Breaker Status and Control Module (BSCM) Modbus SL or ULP

Functions

The optional BSCM Breaker Status & Control Module is used to acquire device status indications and control the communicating remote-control function. It includes a memory used to manage the maintenance indicators.

Status indications

Indication of device status:

Auxiliary switch (OF), alarm switch (SD), and overcurrent trip switch (SDE).

Maintenance indicators

¹⁵⁹. Modbus serial only ≤ 480 Vac. Use only with matching Modbus serial components.

The BSCM manages the following indicators:

- mechanical operation counter
- electrical operation counter
- history of status indications.

It is possible to assign an alarm to the operation counters.

Controls

The BSCM can be used to carry out communicating remote control operations using the communicating motor operator (open, close and reset) in different modes (manual, auto).

Mounting

The BSCM can be installed on all PowerPacT H-, J-, and L-frame circuit breakers and automatic switches with MicroLogic trip units. It simply clips into the auxiliary contact slots. It occupies the slots of one auxiliary switch (OF) and one overcurrent trip switch (SDE). The BSCM is supplied with 24 Vdc power automatically through the NSX or Modbus Serial Cord when the communication network is installed.

BSCM Catalog Numbers

Description	Catalog No. ¹⁶⁰
Replacement BSCM for Modbus SL or ULP	S434220
BSCM with NSX ULP Cord 1.3m V ≤ 480 Vac	S434201BX
BSCM with NSX ULP Cord 3.0m V ≤ 480 Vac	S434202BX
BSCM with NSX ULP Cord 1.3m V > 480 Vac	S434204BX
BSCM with NSX ULP Cord 3.0m V > 480 Vac	S434303BX
BSCM with MB SL Cord 3.0m for V ≤ 480 Vac ¹⁶¹	S434223BX
BSCM with MB SL Cord 1.3m for V ≤ 480 Vac ¹⁶¹	S434222BX
BSCM with MB SL Cord 0.35m for V ≤ 480 Vac ¹⁶¹	S434221BX

Modbus Serial Hub

The Modbus Serial Hub is an optional wiring aid for daisy chaining up to four Modbus Serial devices using RJ45 connectors, wired terminal block connection and/or a compatible stacking connector (TRV00217). The Modbus Serial Hub can support direct wiring of up to three breakers using the BSCM (S434220) with MB SL Cords¹⁶². The Modbus Serial Hub is DIN Rail mountable and stackable with IFMs (LV434000)

160. BSCM legacy CR# S434205 is for ULP architectures using NSX cords only. BSCM Modbus SL/ULP CR# S434220 is compatible with NSX cords or Modbus SL Cords.

161. Modbus serial only ≤ 480 Vac. Use only with matching Modbus serial components.

162. Modbus serial only ≤ 480Vac. Use only with matching Modbus serial components.

and IFEs (LV434001 / LV434002) to use in mixed communication architectures. Multiple Modbus Serial Hubs can be used together to further expand communications with additional stacking connectors or wired through the terminal block.

Description	Catalog No.
Modbus SL Hub ¹⁶³	S434224

24 Vdc Power Supply Terminal Block

24 Vdc Terminal Block

The MicroLogic 5/6 trip unit display is operational when current is flowing through the circuit breaker. To power the MicroLogic 5/6 trip unit when the trip unit is not connected to an FDM121 or to the communication network, a 24 Vdc power-supply terminal block can be installed only on MicroLogic 5/6 trip units. When used, it excludes connection of an NSX cord.

24 Vdc Catalog Number

Description	Catalog No.
24 Vdc Terminal Block Unit Mount	S434210

External 24 Vdc Power Supply Module

External 24 Vdc Power-Supply Module

An external 24 Vdc power supply is required for installation in a communication network, whatever the type of trip unit.

On installations without a communication network, the power supply is available as an option for MicroLogic 5/6 trip units in order to:

- modify settings when the circuit breaker is open
- display measurements when the current flowing through the circuit breaker is low (15 to 50 A depending on the rating)
- maintain the display of the cause of tripping and interrupted current.

A single external 24 Vdc supply may be used for the entire network, depending on the number of devices in the communication network. The required characteristics are:

- output voltage: 24 Vdc $\pm$ 5%
- ripple: $\pm$ 1%

Available External Power-Supply Modules (1 A)

Available External Power-Supply Modules		Input Voltage	Output Power	Catalog No.
Power supply	Vdc ($\pm$ 5%)	24–30	24 Vdc 1 A	685823
		48–60		685824
		100–125		685825
	Vac (+10%, -15%)	110–130		685826
		200–240		685827
		380–415		685829

163. Modbus serial only $\leq$ 480Vac. Use only with matching Modbus serial components.

To determine the required output current of the 24 Vdc power supply, it is necessary to sum up the currents consumed by the different loads supplied.

Power Requirements

Module	Typical Consumption 24 Vdc at 68°F (20°C)	Maximum Consumption 19.2 Vdc at 140°F (60°C)
MicroLogic 5/6 trip units	30 mA	55 mA
BSCM Legacy (S434205)	9 mA	15 mA
BSCM Modbus SL/ULP (S434220)	30 mA	45 mA
Modbus Hub	3 mA	5 mA
FDM121	21 mA	30 mA
IFM	21 mA	30 mA
Isolated Modbus Repeater Module	15 mA	19 mA

For installation recommendations, see 24 Vdc Power Supply Terminal Block, page 137.

Battery Module

Battery Module

The battery module is a back-up supply for the external power-supply module. The input/output voltages are 24 Vdc and it can supply power for approximately three hours (100 mA).

Battery Module

Description	Catalog No.
Battery Module	685831

Pocket Tester

Pocket Tester

The pocket tester connects to the MicroLogic trip unit test connector. It powers up the MicroLogic trip unit and the Ready LED. It supplies the screen, allows settings to be made using the keypad, and provides thermal imaging inhibit functions.

The pocket tester runs off of two Alkaline AA batteries.

Pocket Tester Catalog Number

Description	Catalog No.
Pocket Tester	S434206

Isolated Modbus Repeater Module

Isolated Modbus Repeater
Module

Since Modbus interface modules (part number STRV00210) are not isolated, an isolated Modbus Repeater Module needs to be inserted between the Modbus network inside the equipment and the Modbus network outside the equipment.

Isolated Modbus Repeater Module	STRV00211

Service Interface (SI)

The SI (LV485500) is a portable instrument designed for field testing and configuration of MicroLogic™ trip units mounted in PowerPac™ H-, J-, and L-frame circuit breakers. The user interface, EcoStruxure™ Power Commission (EPC), is a global software with test functions and features for testing the circuit breakers and communication accessories through the Service Interface.

Specific test functions and compatibility, by the circuit breaker, can be found in the SI user guide (DOCA0170EN-04).

Universal Logic Plug

ULP Symbol

The Universal Logic Plug (ULP) system allows the PowerPacT H-, J- and L-frame circuit breakers to become metering and supervision tools to assist for energy efficiency. For easy connection of the different modules, the prefabricated cables are identified by a ULP symbol. The connection points on compatible modules are marked in the same manner.

For more information about the ULP System, see bulletin 48940-329-01, *ULP (Universal Logic Plug) Connection System—User Guide*.

External Neutral Current Transformer (ENCT)

External Neutral Current Transformer

The external neutral current transformer is a sensor required for a three-pole circuit breaker in a system with a distributed neutral to measure the neutral current in order to:

- protect the neutral conductor
- protect against ground faults.

This current transformer can be connected to MicroLogic 5/6 trip units. The transformer rating must be compatible with that of the circuit breaker.

ENCT Catalog Numbers

Circuit Breaker	Rating	Catalog No.
H-Frame	60–100 A	S429521
	150 A	S430562
J-Frame	250 A	S430563
L-Frame	400–600 A	S432575

For installation recommendations, see External Neutral Current Transformer (ENCT), page 197.

External Neutral Voltage Tap (ENVT)

External Neutral Voltage Tap

The external neutral voltage tap is required for MicroLogic E power metering with a three-pole circuit breaker in a system with a distributed neutral. It is used to connect the neutral to the MicroLogic trip unit to measure phase-to-neutral (Ph-N) voltages.

The ENVT is included with the MicroLogic 5/6 electronic trip unit.

Zone Selective Interlock (ZSI) Module

ZSI Module

A ZSI terminal block may be used to interconnect a number of MicroLogic trip units to provide zone selective interlocking for short-time (I_{sd}) and ground-fault (I_g) protection, without a time delay. For PowerPacT H- and J-frame circuit breakers, the ZSI function is available only in relation to the upstream circuit breaker (ZSI out). For PowerPacT L-frame circuit breakers, the ZSI function is available in relation to the upstream circuit breaker (ZSI out) and downstream circuit breakers (ZSI in).

Accessories and Auxiliaries

All PowerPacT H-, J-, and L-frame circuit breakers and automatic switches have slots for the electrical auxiliaries.

H- and J-Frame

- 4 indication contacts
 - 2 ON/OFF (auxiliary switches [OF1 and OF2])
 - 1 trip indication (alarm switch [SD])
 - 1 fault-trip indication (overcurrent trip switch [SDE])
- one remote-tripping release
 - either 1 undervoltage trip (MN)
 - or 1 shunt trip (MX)

L-Frame

- 5 indication contacts
 - 3 ON/OFF auxiliary switches (OF1, OF2, and OF3)
 - 1 trip indication (alarm switch [SD])
 - 1 fault-trip indication (overcurrent trip switch [SDE])
- one remote-tripping release
 - either 1 undervoltage trip (MN)
 - or 1 shunt trip (MX)

Circuit breakers equipped with MicroLogic trip units may be equipped with a fault-trip indication to identify the type of fault by installing one indication module with two outputs:

- either an SDx module with MicroLogic 3.x / 5.x A or E / 6.x A or E
- or an SDTAM module with MicroLogic 2.x M

See [Auxiliary and Alarm Indication Contacts](#), page 150.

This module occupies the slots of one auxiliary switch (OF) contact and an undervoltage trip (MN)/shunt trip (MX).

All these auxiliaries may be installed with a motor operator.

Communication Network

Communication networks require specific auxiliaries.

Communication of status indications:

- 1 BSCM module
- 1 NSX cord (internal terminal block) for both communication and 24 Vdc supply to the BSCM.

Communication of status conditions is compatible with a standard motor operator.

Communication of status indications and controls requires, in addition to the auxiliaries listed above, the following:

- 1 communicating motor operator connected to the BSCM.

Communication of measurements is available on MicroLogic 5/6. The system consists of:

- 1 NSX cord (internal terminal block) for both communication and 24 Vdc supply to the MicroLogic.

Communication of measurements is compatible with a standard or communicating motor operator.

Communication of status indications, controls and measurements is available on MicroLogic 5/6. The system consists of:

- 1 BSCM module
- 1 NSX cord (internal terminal block) for both communication and 24 Vdc supply to the BSCM and the MicroLogic
- 1 communicating motor operator connected to the BSCM.

Installation of SDx or SDTAM is compatible with communication network.

For Modbus Serial direct connection use:

- 1 BSCM module
- 1 Modbus SL cord for both communication and 24 Vdc supply to BSCM ¹⁶⁴

¹⁶⁴. Modbus serial only <= 480 Vac. Use only with matching Modbus serial components.

The terminal block is shown with various terminals for different functions, and the wiring is color-coded to match the terminal block labels.

Accessory Connections

Electrical accessories are fitted with numbered terminal blocks for wires with the following maximum size:

- 16 AWG (1.5 mm²) for auxiliary switches (OF1 or OF2), and shunt trip (MX) or undervoltage trip (MN)
- 14 AWG (2.5 mm²) for the motor operator

Auxiliary switch wiring exits fixed mounted devices through a knock-out in the front cover.

NOTE: See Plug-In Circuit Breaker Mounting, page 177 for plug-in and Drawout Mounting, page 179 for drawout options.

Auxiliary and Alarm Indication Contacts

Auxiliary indication contacts provide remote information of the circuit breaker status and can thus be used for indications, electrical locking, relays, etc.

Auxiliary and Alarm Indication Contacts

Applications	Open/Closed—Auxiliary Switches (OF) • Indicates the position of the circuit breaker contacts Trip Indication—Alarm Switch (SD) • Indicates that the circuit breaker has tripped due to an overload, short circuit or ground fault, the operation of a shunt trip or undervoltage trip or the “push-to-trip” button • Resets when the circuit breaker is reset Overcurrent Trip Switch (SDE) • Indicates that the circuit breaker has tripped due to an overload, short circuit or ground fault • Resets when the circuit breaker is reset The above switches are also available in low-level versions (with gold flash plating) capable of switching very low loads (e.g., for controlling PLCs or electronic circuits) Rotary Handle Indicator: CAO (early-break) and CAF (early-make) • Fitted in the rotary handle module (see Rotary Operating Handles, page 160).
	Installation & Connection • The auxiliary switch (OF), alarm switch (SD), and overcurrent trip switch (SDE) indication contacts snap into cavities behind the front accessory cover of the circuit breaker. • One model serves for all indication functions depending on where it is fitted in the circuit breaker. • The overcurrent trip switch (SDE) in a circuit breaker equipped with a thermal-magnetic or MicroLogic 1/2/3 trip unit requires the SDE actuator.
	Standards • The internal accessories comply with requirements of Underwriters Laboratories® Inc. (UL®). • UL 489 and Canadian Standard Association C22.2 No. 5-02 Standards. • All internal accessories are Listed for field installation per UL file E103955 and Certified under CSA file LR 69561. • Auxiliary indicator contacts comply with UL 489, CSA C22.2 No. 5-02 and IEC 60947-5 Standards. “Low-level” indicator contacts are not UL Recognized.

SDx and SDTAM Modules for MicroLogic Trip Units

SDx and SDTAM are relay modules with two outputs. They send different signals depending on the type of fault. They may not be used together.

SDx Module

SDx module with terminal block.

The SDx module remotely monitors the trip or alarm conditions of PowerPacT H-, J-, and L-frame circuit breakers equipped with electronic protection.

An SDx relay module installed inside the circuit breaker can be used to remote the overload trip signal.

This module receives the signal from the MicroLogic electronic trip unit through an optical link and makes it available on the terminal block. The signal is cleared when the circuit breaker is closed. These outputs can be reprogrammed to be assigned to other types of tripping or alarm.

The SDx module may be used in 400 Hz systems for voltages from 24 to 440 V.

The SD2 output, available on all MicroLogic trip units, corresponds to the overload-trip indication.

The SD4 output, available on MicroLogic 5/6, is assigned to:

- overload pre-alarm (MicroLogic 5)
- ground-fault trip indication (MicroLogic 6)

These two outputs automatically reset when the device is closed (turned ON).

For MicroLogic 5/6, the SD2 and SD4 outputs can be reprogrammed to be assigned to other types of tripping or alarm.

It is possible to assign a function output characteristics:

- latching with a time delay. Return to the initial state occurs at the end of the time delay
- permanent latching. Return to the initial state takes place through the communication function.

Static outputs: 24–415 Vac / Vdc; 80 mA max.

SDTAM Module

SDTAM module with terminal block

The SDTAM module, linked to the contactor controller, opens the contactor when an overload or other motor fault occurs, thus avoiding opening of the circuit breaker. The SDTAM module is specifically for the motor-protection MicroLogic trip units 2 M (2.2 M and 2.3 M).

MicroLogic 2 M

The SD4 output opens the contactor 400 ms before normal circuit-breaker opening in the following cases:

- overload (long-time protection for the trip class)
- phase unbalance or phase loss

The SD2 output serves to memorize contactor opening by SDTAM.

Output characteristics

Output reset can be:

- manual by a pushbutton included in the wiring diagram
- automatic after an adjustable time delay (1 to 15 minutes) to take into account the motor-cooling time

Static outputs: 24–415 Vac / Vdc; 80 mA max. a (+) 24–415 V.

SDx and SDTAM Catalog Numbers

Description	Factory-Installed Suffix	Catalog No.
SDx	V	S429532
SDTAM	V	S429424

Shunt Trip (MX) and Undervoltage Trip (MN)

A voltage release can be used to trip the circuit breaker using a control signal.

Shunt Trip and Undervoltage Trip

Applications	Shunt Trip (MX) - Trips the circuit breaker when the control voltage rises above 70% of its rated voltage - Impulse type ≥ 20 ms or maintained control signals - AC shunt trips are suitable for ground-fault protection when combined with a Class I ground-fault - Sensing element - Continuous duty rated coil Undervoltage Trip (MN) - Trips the circuit breaker when the control voltage drops below a tripping threshold - Drops out between 35% and 70% of the rated voltage - Continuous duty rated coil - Circuit breaker closing is possible only if the voltage exceeds 85% of the rated voltage. If an undervoltage condition exists, operation of the closing mechanism of the circuit breaker will not permit the main contacts to touch, even momentarily. This is commonly called "Kiss Free."
	Installation and Connection - Accessories are common to H-, J-, and L-frame circuit breakers and snap into cavities under the front accessory cover of the circuit breaker. - Each terminal may be connected by one 18–14 AWG (1.0–2.5 mm²) stranded copper wire.
	Operation - The circuit breaker must be reset locally after being tripped by shunt trip (MX) or undervoltage trip (MN). - Tripping by the shunt trip or undervoltage trip has priority over manual (or motor operator) closing; in the presence of a standing trip order such an action does not result in any closing, even temporarily, of the main contacts. - Endurance: 50% of the rated mechanical endurance of the circuit breaker

Motor Operator

The motor operator remotely operates the circuit breaker featuring easy and sure operation:

- All circuit breaker indications and information remain visible and accessible, including trip unit settings and circuit breaker connection.
- Suitability for isolation is maintained and padlocking remains possible.
- Double insulation front face

1. Contact position indicator (suitability for isolation)
2. Spring status indicator (charged, discharged)
3. Manual spring-charging handle
4. Keylock device
Locking device (off position) using one to three padlocks, diameter 0.2–0.32 in. (5–8 mm), not supplied
5. ON push button
6. OFF push button
7. Manual/auto mode selection switch; the position of the switch can be indicated remotely.
8. Operation counter

Applications:

- Local motor-driven operation, centralized operation, automatic distribution control
- Normal/standby manual transfer or switching to a replacement source to optimize energy costs
- Load shedding and reconnection to optimize energy costs
- Less than five cycle closing time for source synchronization

Installation and Connection

- All installations are available for H- and J-frame circuit breakers.
- All installations are available for L-frame circuit breakers except I-Line.
- Connections of the motor operator module are to a built-in terminal block behind its front cover.
- Stranded copper wire 14 AWG (2.5 mm²)

Automatic Operation

- The motor operator is connected in series with the overcurrent trip switch (SDE).
- ON and OFF by two impulse type or continuous control signals
- Depending on the wiring, resetting can be done locally, remotely or automatically.
- Mandatory manual reset following tripping due to an electrical fault (with overcurrent trip switch)

Manual Operation

- Transfer to manual mode with possibility of remote mode indication
- ON and OFF by two push buttons
- Recharging of stored-energy system by pumping the lever
- Padlocking in off position

169. For H- and J-frame, the inrush current is 2x operating current for 10 ms.

170. For NSX cord (communication suffixes EA, EB, ED, and EE) any motor operator may be selected. For BSCM + NSX cord (communication suffixes EB, EH, EK, and EL) only the communicating motor operator may be selected.

Add-On Ground-Fault Module (GFM) (H- and J-Frame Only)

J-Frame Circuit Breaker with GFM Installed

The MicroLogic Ground-Fault Module (GFM) is a UL Listed/CSA Certified circuit breaker accessory which protects equipment from damage caused by ground faults. It is an add-on module which, when connected to a PowerPacT H- or J-frame thermal-magnetic circuit breaker only, provides ground-fault sensing and ground-fault relay functions.

HD/JD ground-fault modules feature:

- Adjustable ground-fault pickup levels
- Adjustable ground-fault time delays
- Integral ground-fault push-to-test feature
- Ground-fault indicator (mechanical for local, contacts for remote)
- All GFMs are supplied for I-Line mounting as standard, easily convertible to unit mount by removing the I-Line bracket.
- Fault-powered (through the sensing current transformer) for electronics, shunt trip, and integral test feature. Meets NEC 230.95(C).
- A 12 Vdc shunt trip module (Catalog No. S29382) is required in the circuit breaker. This may be field installed or factory installed when the circuit breaker is ordered with an -SN suffix.
- UL 1053 – Ground-fault Sensing and Relaying Equipment

The GFM system requires the following:

- H-frame (15–150 A) or J-frame (150–250 A) molded case circuit breaker
- Shunt trip for circuit breaker (may be factory-installed or field-installed)
- Bus bar connection (terminal nut inserts) for OFF end of circuit breaker
- Optional neutral current transformer, catalog number GFM25CT (must be ordered for 4-wire applications).

Ground Fault Modules

Catalog No.	Rating	Sensitivity	Time Delay (Approximate)
GFM150HD	150 A	20, 40, 60, 80, 100 A	0.2, 0.3, 0.4, 0.6 sec
GFM250JD	250 A	40, 80, 120, 160, 200 A	0.2, 0.3, 0.4, 0.6 sec

Earth Leakage Module (ELM) (H- and J-Frame Only)

J-Frame Circuit Breaker
with ELM Installed

The Earth Leakage Module (ELM) is an add-on module which, when connected to a PowerPacT H- or J-frame MCCB, provides low-level ground-fault sensing and ground-fault relay functions.

Because these ELMs are highly sensitive (30 mA to 3 A), they provide much greater protection than GFM's (20 to 200 amperes sensitivity). The ELMs provide greater protection of control circuits and other sensitive equipment. The associated circuit breaker must have a 48 Vdc shunt trip, which may be field-installed (kit S29392) or factory-installed (suffix –SP) in the H- or J-frame circuit breaker.

The add-on Earth Leakage Module (ELM) features:

- Adjustable ground-fault pickup levels as low as 30 mA
- Adjustable ground-fault time delays from instantaneous to 500 msec (time delay can be applied to any setting)
- Integral ground fault push-to-test feature
- Ground-fault indicator; pop-up button for local status and contacts for remote indication (to be used only with the tripping option)
- All ELMs are supplied for I-Line mounting and are easily convertible to unit-mount by removing the I-Line mounting feet
- Three poles; 240 to 600 Vac maximum: 3-phase, 3-wire (no neutral) and 1-phase, 2-wire applications
- Line-power obtained through internal bus to provide power for electronics, shunt trip, and integral test feature
- A shunt trip is required in the circuit breaker; it may be field-installed or factory-installed in the PowerPacT H and J circuit breakers.
- UL 1053—Ground-fault Sensing and Relaying Equipment

ELM Selection Chart

Companion Circuit Breaker		Enclosure Space Required I-Line Equipment	Catalog No.	Pick-Up Adjustments	Ground-Fault Time Delay Adjustments
Prefix	Size				
HD, HG, HJ, HL	15–150 A	LA	ELM150HD	30 mA 100 mA 300 mA 1A 3A	Instantaneous 60 ms 100 ms 500 msec
JD, JG, JJ, JL	150–250 A ¹⁷¹	LA	ELM250JD		

Factory-Installed ELMs

The catalog number for circuit breakers with factory-installed ELM should include the special suffixes SP and VL or VM: H D M 3 6 150 SP VL

where

- H = H-frame (or J = J-frame)
- D = D interruption level (or G, J or L)
- M = Lugs on ON end and terminal nuts on OFF end (required)
- SP = Factory-installed 48 Vdc shunt trip (S29392, required)
- VL = Earth Leakage Module (ELM) <150 A (H-frame) or
VM = Earth Leakage Module (ELM) <250 A (J-frame)

171. At 250 A, the ELM250JD can be used with standard (80%) rated circuit breakers only.

Rotary Operating Handles

Directly Mounted Rotary Operating Handles

Directly Mounted Rotary Operating Handle

Installation ¹⁷²	The directly mounted rotary operating handle replaces the circuit breaker front accessory cover (secured by screws).	
Operation	The direct rotary handle maintains: - Suitability for isolation - Indication of three positions: I (ON), Tripped and O (OFF) - Access to the “push-to-trip” button - Visibility of, and access to, trip unit settings - The circuit breaker may be locked in the OFF position by using one to three padlocks (not supplied).	I/ON (Closed) Tripped O/OFF (Open)
Models	- Standard with black handle - VDE type with red handle and yellow bezel for machine tool control	
Variations	Accessories transform the standard direct rotary handle for the following situations: - Motor control centers (MCCs): - Opening of door prevented when circuit breaker is on. - Closing of circuit breaker inhibited when door is open. - Machine tool control: complies with CNOMO E03.81.501N; degree of protection IP54 - Early make or early break contacts may be installed into direct mount rotary handle.	
Standards	The directly-mounted rotary operating handle is UL Listed under file E103955 and CSA Certified under file LR 69561.	

172. Visi-Trip is not compatible with handle accessories.

Door-Mounted (Extended) Rotary Operating Handle

Door Mounted Rotary Operating Handle

Installation	The door-mounted (extended) rotary operating handle is made up of: • A unit that replaces the front accessory cover of the circuit breaker (secured by screws) • An assembly (handle and front plate) on the door that is always secured in the same position, whether the circuit breaker is installed vertically or horizontally • An adjustable extension shaft • The handle mechanism can be used in NEMA 3R and 12 enclosure applications.
Operation	The door mounted operating handle makes it possible to operate a circuit breaker installed in an enclosure with the enclosure door closed. The door mounted operating handle maintains: • Suitability for isolation • Indication of the three positions OFF (O), ON (I) and tripped • Visibility of, and access to, trip unit settings when the door is open • Degree of protection: IP40 as per IEC 529 Defeatable interlock prevents opening of door when circuit breaker is on. The circuit breaker may be locked in the off position by using one to three padlocks, padlock shackle diameter 0.19–0.31 in. (5–8 mm); padlocks are not supplied; locking prevents opening of the enclosure door.
Shaft Length	The shaft length is the distance between the back of the circuit breaker and the door: • Minimum shaft length is 7.4 in. (185 mm). • Maximum shaft length is 24 in. (600 mm). • Extended shaft length must be adjusted.
Models	• Standard with black handle • VDE type with red handle and yellow bezel for machine tool control
Variations	For drawout configurations, the extended rotary handle is also available with a telescopic shaft containing two stable positions.
Standards	The door-mounted rotary operating handle is UL Listed under file E103955 and CSA Certified under file LR 69561.

Class 9421 NEMA Door Mounted Rotary Operating Handles

Installation	The extended rotary operating handle is made up of: - A mounting plate that provides a rotary actuator for a standard toggle circuit breaker - Handle assemblies available for NEMA 3, 3R, 4, and 4X - Available in standard or short (3 in.) handle assemblies
Operation	The door mounted operating handle makes it possible to operate a circuit breaker installed in an enclosure with the enclosure door closed. Provides ON (I) and OFF (O) indication. The circuit breaker may be locked in the off position.
Shaft Length	The shaft length is the distance between the back of the circuit breaker and the door: - Minimum mounting depth is 5.5 in. (138 mm). - Maximum mounting depth is 10.75 in. (273 mm) with standard shaft. - Maximum mounting depth is 21.3 in. (543 mm) with long shaft.

Class 9422 Cable Operating Handle

Flange-mounted handle cable operating mechanism is for use with Class 9422 Type A handle operators especially designed for tall, deep enclosures where placement flexibility is required.

Applications	- The cable operator maintains: - Suitability for isolation - Indication of three positions: O (OFF), I (ON) and tripped - Access to push-to-test - The circuit breaker may be locked in the off position by one to three padlocks. - Door can be locked closed due to interlocking features of the handle operator.
Installation	- Handle is mounted on flange of enclosure using specified mounting dimensions while circuit breaker and operating mechanism are mounted to inside of enclosure using two screws. - Cable lengths available in 3-, 5- or 10-foot lengths to accommodate a variety of mounting locations. Handles are available in painted NEMA 1, 3, 3R, 4 (sheet steel) and 12 ratings or chrome (NEMA 4, 4X).

Refer to NEC Article 430-10 for minimum dimension X from circuit breaker top mounting hole to wall or barrier to ensure adequate wire bending space.

NOTE: Bend radius in cable must never be less than 6 in. (152 mm). Electrical clearances must be maintained between cable and live electrical parts.

Dimensions: in.
(mm)

Class 9422 Cable Operating Mechanisms and A1 Handles

Description		H- and J-Frame Kit Number	L-Frame Kit Number

A1 Painted Flange Handle		—	9422A1
Operating Mechanism Only		—	9422RS1

Class 9422 Flange-Mounted Variable-Depth Operating Mechanism

Threaded-rod flange-mounted variable depth operating mechanism

Designed for installation in custom built control enclosures where main or branch circuit protective devices are required.

- All circuit breaker operating mechanisms are suitable for either right- or left-hand flange mounting, convertible on the job.
- H- and J-frame variable mounting depth range: 5.88–17.75 in. (149–451 mm).
- H- and J-frame operating mechanism 9422RQ1 does not include handle mechanism.

L-Frame Flange-Mounted Operating Mechanism

Description	Depth	Kit Number
Variable Depth Mechanism	9.00–17.75 in. (229–451 mm)	9422RSI

Locking Systems

Padlocking systems can receive up to three padlocks with diameters of 0.19–0.31 in. (5–8 mm); padlocks not supplied.

H- and J-Frame

L-Frame

Device Locking, Interlocking Options

Device	Description		Field-Installed Cat. No.

Handle Padlocking Device ¹⁷⁴	Removable (lock OFF only)		S29370	S29370
	Fixed (lock OFF or ON)		HJPA	S32631
	Fixed (lock OFF only) ¹⁷⁵		HJPA	NJPAF
Key Locking	Provision and 2 locks keyed alike	Ronis	—	S41950
		Profalux	—	S42878

¹⁷⁴. Rotary handles and motor operators have integral padlocking capability.

¹⁷⁵. Not available in HD or HG two-pole modules.

Manual Mechanical Interlocking System

Some installations use two power supply sources to counter any temporary loss in the main supply. A mechanical interlocking system is required to safely switch between the two sources. The replacement source can be a generator set or another network.

Managing multiple power sources can be controlled manually by mechanical interlocks.

The mechanical interlocking system is made up of:

- two H-, J-, or L-frame devices (circuit breakers or switches) controlled manually
- mechanical interlocking, which prevents handle movement from the OFF position while the other device is in the ON position.

Since it is controlled manually by a maintenance technician, switchover time from the normal source to the replacement source can vary.

H- and J-Frame

Interlocking with Toggle Control (S29354)

Interlocking with Rotary Handles (S29369)

L-Frame

Interlocking with Toggle Control (S32614)

Interlocking with Rotary Handles (S32621)

Interlocking of Circuit Breakers with Toggle Control

Two devices can be interlocked using this system. Two identical interlocking systems can be used to interlock three devices installed side by side.

Authorized positions:

- one device closed (ON), the others open (OFF)
- all devices open (OFF)

The system is locked using one or two padlocks (shackle diameter 0.19–0.31 in. [5 to 8 mm]). This system can be expanded to more than three devices.

There are two interlocking-system models:

- one for PowerPacT H- and J-frame circuit breakers
- one for PowerPacT L-frame circuit breakers

All toggle-controlled unit-mount or plug-in PowerPacT H-, J-, and L-frame circuit breakers and automatic switches of the same frame size can be interlocked. The devices must be either all unit-mount or all plug-in versions. Interlocking is not available for I-Line constructions.

The toggle interlock system can receive one or two padlocks with diameters of 0.19–0.31 in. (5–8 mm). Both interlocked circuit breakers must be unit-mount or both plug-in. Two sliding interlocking bars can be used to interlock three circuit breakers installed side-by-side, in which case one circuit breaker is in the ON (I) position and the two others in the OFF (O) position. (Kit S29354, not available for two-pole HD and HG devices.)

Interlocking of Two Devices with Rotary Handles

Interlocking involves padlocking the rotary handles on two devices which may be either circuit breakers or automatic switches.

Authorized positions:

- one device closed (ON), the other open (OFF)
- both devices open (OFF).

The system is locked using up to three padlocks (shackle diameter 0.19–0.31 in. [5 to 8 mm]).

There are two interlocking-system models:

- one for PowerPacT H- and J-frame circuit breakers
- one for PowerPacT L-frame circuit breakers

All rotary-handle unit-mount or plug-in PowerPacT H-, J-, and L-frame circuit breakers and automatic switches of the same frame size can be interlocked. The devices must be either all unit-mount or all plug-in versions. Interlocking is not available for I-Line constructions.

The rotary handles are padlocked with the devices in the OFF (I) position. The interlock mechanism inhibits the two devices from being closed (ON/I) at the same time, but allows for both devices to be open (OFF/O) simultaneously. (Kit S29369. Not available for two-pole HD and HG devices.)

Interlocking Accessories

Accessory	Means	Kit Number	
		H-, J-Frame	L-Frame
Interlocking (UL Listed)	Mechanical for circuit breakers with rotary handles ¹⁷⁶	S29369	S32621
	Mechanical for circuit breakers with toggles ¹⁷⁶	S29354	S32614

176. Not available in HD or HG two-pole modules.

Interlocking Devices using Keylocks (Captive Keys)

Interlocking with Keys

Interlocking using keylocks makes it possible to interlock two or more devices that are physically distant or that have very different characteristics, for example medium-voltage and low-voltage devices or a PowerPacT H-, J-, and L-frame circuit breaker and automatic switch.

Each device is equipped with an identical keylock and the key is captive on the closed (ON) device. A single key is available for all devices. It is necessary to first open (OFF position) the device with the key before the key can be withdrawn and used to close another device.

All rotary-handle PowerPacT H-, J-, and L-frame circuit breakers and automatic switches can be interlocked between each other or with any other device equipped with the same type of keylock.

For circuit breakers equipped with rotary handles or a motor operator. Interlocking with keys may be easily implemented by equipping each of the circuit breakers, either unit-mount or drawout, with a directly mounted rotary operating handle and a standard keylock, with only one key for the two keylocks. This solution enables interlocking between two circuit breakers that are geographically distant or that have significantly different characteristics.

Use:

- A keylock adapter (one required for each circuit breaker)
- Two identical keylocks with a single key

See [Rotary Operating Handles](#), page 160 for more information.

Sealing Accessory

The sealing accessory kits includes the elements required to fit seals to prevent:

- Front accessory cover removal
- Rotary handle removal
- Opening of the motor operator
- Access to accessories
- Access to trip unit settings
- Access to ground-fault protection settings
- Trip unit removal
- Terminal cover removal
- Access to power connections

Sealing Accessory Kits

Description	Kit Number	Qty.
Trip Unit Sealing Accessory Kit	MICROTUSEAL	6
Front Cover Screws Sealing Accessory Kit	S29375	6

Front-Panel Escutcheons

- For unit-mount or plug-in installation
- Front-panel escutcheons for toggle handles secure to the panel from the front.
- Front-panel escutcheons for motor-operated or rotary-operating handles secure to the panel by four screws from the front.

Front-Panel Escutcheons

Description	Kit Number	
	H-, J-Frame	L-Frame
Front Panel Escutcheon for Toggle Circuit Breakers	S29315	32556
Front Panel Escutcheon for Rotary Handle, Motor Operator or Extended Escutcheon	S29317	S32558

Toggle Collars (For Drawout Mounting)

Toggle collars make it possible to maintain degrees of protection regardless of the circuit breaker position (connected, disconnected):

- Front panel escutcheons are required (identical to those for rotary handle and ammeter module).
- Toggle collars are secured by two screws on the circuit breaker.
- Front panel escutcheons are secured on the enclosure.
- Toggle extension is supplied with the toggle collar.

Front panel escutcheons for motor operator and rotary operating handles are the same as for the unit-mount circuit breakers.

Toggle Collars

Circuit Breaker Enclosures and Enclosure Accessories

- Square D brand circuit breaker enclosures are UL Listed/CSA Certified and are suitable for use as service entrance equipment, except as footnoted.
- The short-circuit rating of an enclosed circuit breaker is equal to the rating of the circuit breaker installed, except as footnoted.
- Circuit breakers are ordered and shipped separately for field installation.

Minimum Enclosure Dimensions

Circuit Breaker	Amperage	Enclosure Dimensions (h x w x d)	
		Standard (80%)	100% Rated
HD/HG/HJ/HL	15–150 A	15.6 x 6.12 x 3.49 in. (396 x 155 x 89 mm)	15.6 x 6.12 x 3.49 in. (396 x 155 x 89 mm)
HR		18.13 x 8.63 x 4.13 in. (461 x 219 x 105 mm)	62 x 22.5 x 14 in. (1575 x 572 x 356 mm)

D = Drawout	3 Pole Only	3 or 4 Pole		
S = Rear Connection	3 Pole Only	3 or 4 Pole		

Refer to circuit breaker installation bulletin before installing circuit breaker, accessories, or wiring.

Unit-Mount Circuit Breakers

The standard lugs can be removed for the installation of compression-type lugs or bus connections. All lugs are UL Listed/CSA Certified for their proper application and marked for use with aluminum and copper (Al/Cu) or copper only (Cu) conductors. Lugs suitable for copper and aluminum conductors are made of tin-plated aluminum.

Mounting

H-, J-, and L-frame circuit breakers may be mounted vertically, horizontally or flat on their back without any derating of characteristics.

Unit-mount H- and J-frame circuit breakers are supplied with two mounting screws, unit-mount L-frame circuit breakers are supplied with four mounting screws. These mounting screws are inserted through mounting holes molded into the circuit breaker case and threaded into the mounting enclosure, rails or through the panel door for flush mounting.

A DIN rail mounting bracket (catalog no. S29305) is available for the H- and J-frame circuit breakers.

NOTE: DIN rail mounting is not compatible with motor operated applications.

Unit-Mounting Options

I-Line Circuit Breakers

PowerPacT H-, J-, and L-frame circuit breakers are available in I-Line construction for easy installation and removal in I-Line applications.

I-Line circuit breakers use “blow-on” type line side connectors. In case of a short circuit, increased magnetic flux causes the plug-on connectors of the circuit breaker to tighten their grasp on the bus bars. The I-Line connectors and circuit breaker mounting bracket are integral parts of I-Line circuit breakers and cannot be removed or replaced. I-Line circuit breakers come with mechanical load side lugs, or optional terminal nut to connect to bus bars or to compression (crimp) lugs.

Standard	ABC	—	HDA36150
6	CBA	—	HDA361506

Plug-In Circuit Breaker Mounting

Plug-In Mounting

The plug-in base is mounted through a panel. The plug-in configuration makes it possible to:

- Extract and/or rapidly replace the circuit breaker without having to touch connections
- Allow for addition of future circuits at a later date

When the circuit breaker is in the connected position, the primary voltage is fed through the circuit breaker by means of multiple finger disconnects. Control voltage of internal accessories is provided through secondary disconnects.

Parts of a Plug-In Configuration

- **Plug-in Base:** The plug-in base provides mounting through a front panel or mounting on rails.
- **Disconnects:** Provides both primary and secondary disconnect to the circuit breaker.
- **Safety Trip Interlock:** The safety trip causes automatic tripping if the circuit breaker is ON before engaging or withdrawing it; the safety trip does not prevent the circuit breaker operation, even when the circuit breaker is disconnected.
- **Mandatory short terminal shields.**

Accessory circuits exit the circuit breaker using one to three secondary disconnecting blocks (nine wires each). Circuit breaker connection wires for the options installed with trip unit STR53UP exit through the automatic secondary disconnecting blocks. These are made up of:

- A moving part connected to the circuit breaker through a support (one support per circuit breaker)
- A fixed part mounted on the plug-in base, equipped with connectors for wire up to 14 AWG (2.5 mm²)

Disconnecting Blocks

For test purposes, circuit breakers may be equipped with one to three manual auxiliary connectors, which allow the auxiliaries to remain connected when in the “disconnected” position.

Plug-In Base (Mounting Options)

Manual Auxiliary Connector

Mounting Through a Panel

Mounting on Rails

The L-frame plug-in mounting is Listed under UL file E113555 and Certified under CSA file LR 69561.

Drawout Mounting

The cradle is made up of two side plates installed on the plug-in base and two other plates mounted on the circuit breaker.

The drawout mounting provides all of the functions of the plug-in base, plus:

- Disconnected position—the power circuit is disconnected, the circuit breaker is simply withdrawn and may still be operated (on, off, push-to-trip)
- Circuit breaker may be locked using 1 to 3 padlocks, diameter 0.19 to 0.31 inch (5–8 mm), to prevent connection.
- Auxiliaries can be tested using manual auxiliary connector.

Drawout mounting is on a backplate:

- Through a front panel or on rails
- Horizontally or vertically

Accessories for drawout circuit breakers:

- *Auxiliary contacts indicator* for installation on the fixed part of the cradle, indicating the “connected” and “disconnected” position
- *Toggle collar* for circuit breakers with toggle through front panel, intended to maintain the degree of protections whatever the position of the circuit breakers (supplied with a toggle extension)
- *Keylock* which can be used to
 - Prevent insertion for connection
 - Lock the circuit breaker in the connected or disconnected position
- *Telescopic shaft* for extended rotary handles
- *Control voltage*, which is provided through automatic secondary disconnect in the connected position only. Electrical accessories can be tested in the disconnected position with an external wiring harness.

The drawout-mounted cradle is listed under UL file E113555 and certified under CSA file LR69561.

Set of 4 M10 x 25 terminal screws and washers for one side.	S36967

189. Kit contains four short rear connections, two long rear connections (four long rear connections for four-pole), hardware and two terminal covers.
190. Order two kits (two in kit x two kits for total of four).
192. Order two kits (two in kit x two kits for total of four).
193. Parts only. No hardware is included.
194. For use with three-pole circuit breakers only.
195. Parts only. No hardware is included.
196. Order two kits (kit contains only one terminal cover, two terminal covers are required per circuit breaker).

Mechanical Lugs

Unit-mount H-, J-, and L-frame circuit breakers can be ordered with mechanical line and load side lugs. The standard lugs can be removed for the installation of compression-type lugs or bus connections. All lugs are UL Listed/CSA Certified for their proper application and marked for use with aluminum and copper (Al/Cu) or copper only (Cu) conductors. Lugs suitable for copper and aluminum conductors are made of tin-plated aluminum. Lugs suitable for use with copper conductors only are made of copper.

Mechanical Lugs for the H- and J-frame circuit breakers lay on top of the circuit breaker terminals and can be installed without the use of any tools. The lugs are held in place with snap features built into the insulating retainer and are secured with the clamp force applied to the wire binding screw.

Mechanical lugs are sold either factory installed or as field installable kits.

Mechanical Lug Kits for H-Frame and J-Frame Circuit Breakers

Voltage Takeoff (Control Wire Terminals) for Mechanical Lugs and Terminal Nuts

Mechanical Lug Control Wire Terminal

Busbar Control Wire Terminal

PowerPacT H- and J-Frame mechanical lugs may be equipped with a separate control wire termination. The kit is available factory installed or as a field installable kit. The adaptor is secured underneath the lug and has a tab extension suitable for attachment of a 0.250 inch slip-on connector.

All L-frame mechanical lugs are pre-tapped for control wires. For control wire installation, use an 8–32 x 1/4 in. screw (not provided) into tapped control wire hole in lower left hand corner of the lug.

Fully insulated type connectors must be used to prevent live parts from extending into the wiring gutter area.

Control Wire Terminals

Description	Frame	Cat. No.	Qty. Per Kit
Mechanical Lugs			
Control Wire Terminal for H-Frame Lugs	HD/HG/HJ/HL	S37423	2
Control Wire Terminal for J-Frame Lugs	JD/JG/JJ/JL	S37424	2
Busbar Connection			
Control Wire Terminal for H-Frame Terminal Nut	HD/HG/HJ/HL	S37429	2
Control Wire Terminal for J-Frame Terminal Nut	JD/JG/JJ/JL	S37430	2

201. For control wire installation, use an 8-32 x 1/4 in. screw (not provided) into tapped control wire hole in lower left hand corner of lug.

202. For lug pack information, see .

203. For terminal shield dimensions, see PowerPacT L-Frame Fixed Mounted Circuit Breaker, page 222.

201. Terminal shields are included in mechanical lug kits.

Bus-Bar Connections

The H-, J- and L-frame circuit breakers may be equipped with captive nuts and screws for direct connection to bars or to compression (crimp) lugs.

For H- and J-frame, these are readily field-installable, simply by removing the mechanical lug and replacing with the appropriate terminal nut inset described in *Factory-Installed Terminal Nut Inserts for Bus or Crimp Lug Connection*, page 185. They are also available factory-installed, using the Product Selector or by using the catalog suffixes below.

For L-frame, the mechanical lug can be removed, leaving the threaded nut insert intact. This configuration may be ordered with the suffixes described below. Connection hardware (terminal screws) must be ordered as in *Factory-Installed Terminal Nut Inserts for Bus or Crimp Lug Connection*, page 185.

Factory-Installed Terminal Nut Inserts for Bus or Crimp Lug Connection

Cat. No. Termination (Position 4)	Special Terminations Options	Description
F	—	Terminal nut insert on both ends; no lugs either end
M	—	Terminal nut insert on OFF end; lugs on ON end only
P	—	Terminal nut insert on ON end; lugs on OFF end only

E	0.3 in. (7.6 mm)	0.375 in. (9.5 mm)	0.64 in. (16.3 mm)

L-Frame Bus Bar Connections Hardware

Description	Cat. No.
Set of 4 M10 x 25 terminal screws and washers for one side.	S36967

Power Distribution Connectors

The power distribution connectors (PDC) can be used for multiple load wire connections on one circuit breaker. Use in place of standard distribution blocks to save space and time. Field installable kit includes tin-plated aluminum lug, connectors, and required mounting hardware.

- For use on load end of circuit breaker only
- For use in UL 508 Industrial Control applications
- For use in UL 1995/CSA C22.2 No. 236 heating and cooling equipment
- For copper wire only

Power Distribution Connectors

Frame		Kit No.	Qty. per Kit	Wires per Terminal		Wire Range	Wire Binding Screw Torque
H-Frame		PDC6HD6	3	6		8–6 AWG (10–16 mm ²)	25 lb-in. (2.8 N•m)

						14–10 AWG (2.5–6 mm ²)	20 lb-in. (2.3 N•m)

See Terminal Shields, page 189 for the phase barriers for power distribution connectors.

203. Kit includes terminal shield.

Compression Lugs

Both copper and aluminum compression lug kits are available for the H-, J-, and L-frame circuit breakers. Each kit contains required insulators and all mounting hardware. Compression lugs require the long lug cover pack, see [PowerPacT L-Frame Circuit Breakers](#), page 222.

Compression Lug Kits for Al/Cu Connectors

Installation Recommendations

NOTE: A special 122°F (50°C) rating is available for special high ambient conditions (not UL listed). Order by adding CA suffix to catalog number.

Operation Conditions

Temperature Derating

- PowerPacT H-, J-, and L-frame circuit breakers may be used between -13°F and 158°F (-2°C and +70°C). For temperatures higher than 104°F (40°C) inside the enclosure, devices must be derated.
- Circuit breakers should be put into service under normal ambient, operating-temperature conditions.
- The permissible storage-temperature range for PowerPacT H-, J-, and L-frame circuit breakers in the original packing is -58°F²⁰⁴ and 185°F (-50°C²⁰⁴ and +85°C).

H-Frame Trip Curve

(I_n) Fixed threshold thermal protection against overload
(I_i) **Fixed** threshold instantaneous protection against short circuits

PowerPacT H-, J- and L-Frame Circuit Breakers Equipped with Electronic Trip Units

Electronic trip units are not affected by variations in temperature. If the trip units are used in high temperature environments, the MicroLogic trip unit setting must nevertheless take into account the temperature limits of the circuit breaker.

Changes in temperature do not affect measurements by electronic trip units.

- The built-in CT sensors with Rogowski coils measure the current.
- The control electronics compare the value of the current to the settings defined for 104°F (40°C).

Because temperature has no effect on the CT measurements, the tripping thresholds do not need to be modified.

However, the temperature rise caused by the flow of current combined with the ambient temperature increases the temperature of the device. To avoid reaching the thermal withstand value, it is necessary to limit the current flowing through the device, that is the maximum I_r setting as a function of the temperature.

The table below indicates the maximum long-time (LT) protection setting I_r (A) depending on the ambient temperature.

Derating Circuit Breakers with MicroLogic Trip Units

Type of Device	Rating	Temperature						
		104°F (40°C)	113°F (45°C)	122°F (50°C)	131°F (55°C)	140°F (60°C)	149°F (65°C)	158°F (70°C)
H-Frame								
Unit-mount, plug-in or drawout	60 A	No derating						
	100 A	No derating						
	150 A	No derating						
J-Frame								
Unit-mount	250 A	250	250	250	245	237	230	225
Plug-in or drawout	250 A	250	245	237	230	225	220	215
L-Frame								
Unit-mount	400 A	400	400	400	390	380	370	360
Plug-in or drawout	400 A	400	390	380	370	360	350	340

206. Shaded areas indicate temperature related values, non-shaded areas are standard circuit breaker ampere ratings at 104°F (40°C).

Derating Circuit Breakers with MicroLogic Trip Units (Continued)

Type of Device	Rating	Temperature						
		104°F (40°C)	113°F (45°C)	122°F (50°C)	131°F (55°C)	140°F (60°C)	149°F (65°C)	158°F (70°C)
Unit-mount	600 A	600	600	600	585	570	550	535
Plug-in or drawout	600 A	570	550	535	520	505	490	475

Example. A unit-mount PowerPacT L-frame circuit breaker equipped with a MicroLogic can have a maximum I_r setting of:

- 400 A up to 122°F (50°C)
- 380 A up to 140°F (60°C)

Altitude Derating

Altitude does not significantly affect the characteristics of PowerPacT H-, J-, and L-frame circuit breakers up to 6560 ft. (2000 m). Above this altitude, it is necessary to take into account the decrease in the dielectric strength and cooling capacity of air.

The following table gives the corrections to be applied for altitudes above 6560 ft. (2000 m). The breaking capacities remain unchanged.

Altitude Derating

Altitude		6560 ft (2000 m)	9840 ft (3000 m)	13120 ft (4000 m)	16400 ft (5000 m)
Dielectric withstand voltage		3000 V	2500 V	2100 V	1800 V
Insulation voltage	V_i	800 V	700 V	600 V	500 V
Maximum operational voltage	V_e	690 V	590 V	520 V	460 V
Average current capacity (A) at 104°F (40°C)	$I_n \times$	1.0	0.96	0.93	0.9

Frequency Derating

Application of H- and J-frame circuit breakers at frequencies above 60 Hz requires that special consideration be given to the effects of high frequency on the circuit breaker characteristics. Thermal and instantaneous operations must be treated separately.

At frequencies below 60 Hz, the thermal derating of PowerPacT H and J-frame circuit breakers is negligible. However, at frequencies above 60 Hz, thermal derating is required.

One of the most common high frequency applications is at 400 Hz. For 400 Hz derating information, see *400 Hz Applications*, page 38.

For more information, refer to Data Bulletin 0100DB0101, *Determining Current Carrying Capacity in Special Applications*.

Installation in Equipment

Power from the Top or Bottom

PowerPacT H-, J-, and L-frame circuit breakers with factory-sealed trip units can be supplied from either the top or the bottom without any reduction in performance. This capability facilitates connection when installed in end-use equipment.

All connection and insulation accessories can be used on circuit breakers supplied either from the top or bottom.

Weight

The table below presents the weights of the circuit breakers and the main accessories, which must be summed to obtain the total weight. The values are valid for all performance categories.

Weights

Type of Device	Poles	Circuit Breakers	Base	Cradle	Motor Operator
H-frame, 100 A	2	3.95 lbs. (1.79 kg)	1.75 lbs. (0.8 kg)	4.85 lbs. (2.2 kg)	2.65 lbs. (1.2 kg)
	3	4.52 lbs. (2.05 kg)	1.75 lbs. (0.8 kg)	4.85 lbs. (2.2 kg)	2.65 lbs. (1.2 kg)
H-frame, 150 A	2	4.08 lbs. (1.85 kg)	1.75 lbs. (0.8 kg)	4.85 lbs. (2.2 kg)	2.65 lbs. (1.2 kg)
	3	4.85 lbs. (2.2 kg)	1.75 lbs. (0.8 kg)	4.85 lbs. (2.2 kg)	2.65 lbs. (1.2 kg)
J-frame, 250 A	3	5.29 lbs. (2.4 kg)	1.75 lbs. (0.8 kg)	4.85 lbs. (2.2 kg)	2.65 lbs. (1.2 kg)
L-frame, 600 A	3	13.65 lbs. (6.19 kg)	5.29 lbs. (2.4 kg)	4.85 lbs. (2.2 kg)	6.17 lbs. (2.8 kg)
	4	17.92 lbs. (8.13 kg)	6.17 lbs. (2.8 kg)	4.85 lbs. (2.2 kg)	6.17 lbs. (2.8 kg)

Safety Clearances and Minimum Distances

General Rules

When installing a circuit breaker, minimum distances (safety clearances) must be maintained between the device and panels, bars and other protection devices installed nearby. These distances, which depend on the voltage, are defined by tests carried out in accordance with UL standards.

If installation is not checked by type tests, it is also necessary to:

- use insulated bars for circuit-breaker connections
- segregate the busbars using phase barriers

For PowerPacT H-, J-, and L-frame devices, terminal shields and interphase barriers are recommended and may be mandatory depending on the operating voltage of the device and type of installation (unit-mount, drawout, etc.).

Power Connections

The table below indicates the connection requirements for PowerPacT H-, J-, and L-frame devices to ensure insulation of live parts for the various types of connection.

- unit-mount devices with front connection or rear connection
- plug-in or drawout devices.

Connection accessories such as crimp lugs, terminal extensions (straight, right-angle, double-L and 45°) and spreaders are supplied with interphase barriers. Long terminal shields provide a degree of protection of IP40 (ingress).

Safety Clearance

If dimension A < 0.56 in. for H- and J-frame circuit breaker, attach fiber insulating plate, not provided, to enclosure cover.

Control Wiring

Remote Tripping by Undervoltage Trip (MN) or Shunt Trip (MX)

- Power requirements are approximately:
- 30 VA for pick-up of the undervoltage trip (MN) and shunt trip (MX)
 - 300–500 VA for the motor operator.

Recommended Maximum Cable Lengths

Power Supply Voltage (Vdc)		Length ²⁰⁷					
		12 Vdc		24 Vdc		48 Vdc	
Cable cross-section		16 AWG (1.5 mm²)	14 AWG (2.5 mm²)	16 AWG (1.5 mm²)	14 AWG (2.5 mm²)	16 AWG (1.5 mm²)	14 AWG (2.5 mm²)
Undervoltage Trip (MN)	V source 100%	49 ft. (15 m)	—	525 ft. (160 m)	—	2100 ft. (640 m)	—
	V source 85%	23 ft. (7 m)	—	131 ft. (40 m)	—	525 ft. (160 m)	—
Shunt Trip (MX)	V source 100%	197 ft. (60 m)	—	787 ft. (240 m)	—	3150 ft. (960 m)	—
	V source 85%	98 ft. (30 m)	—	394 ft. (120 m)	—	1575 ft. (480 m)	—
Motor Operator	V source 100%	—	—	33 ft. (10 m)	52 ft. (16 m)	213 ft. (65 m)	361 ft. (110 m)
	V source 85%	—	—	6.6 ft. (2 m)	13 ft. (4 m)	56 ft. (17 m)	82 ft. (25 m)

External Neutral Voltage Tap (ENVT)

- This connection is required for accurate power measurements on three-pole circuit breakers equipped with MicroLogic 5/6 E trip units in installations with a distributed neutral. It can be used to measure phase-neutral voltages and calculate power using the 3 wattmeter method.
- PowerPacT H-, J-, and L-frame three-pole circuit breakers come with a wire installed on the device for the connection to the ENVT. This wire is equipped with a connector for connection to an external wire with:
- cross-sectional area of 18–14 AWG (1 mm² to 2.5 mm²)
 - maximum length of 32.8 ft. (10 m).

External Neutral Current Transformer (ENCT)

This connection is required to protect the neutral on three-pole circuit breakers equipped with MicroLogic 5/6 A or E trip units in installations with a distributed neutral. For MicroLogic 6 A or E, it is required for ground-fault protection.

The ENCT is connected in the same way for unit-mount, plug-in or drawout devices:

- unit-mount devices are connected using terminals T1 and T2 of the internal terminal block.
- plug-in and drawout devices are not connected using the auxiliary terminals.

The wires must be connected/disconnected inside the devices using terminals T1 and T2.

The ENCT must be connected to the MicroLogic trip unit by a shielded twisted pair. The shielding should be connected to the enclosure earth only at the CT end, no more than 12 in. (30 cm) from the CT.

- the power connections of the CT to the neutral (H2 and H1) must be made in the same way for power supply from the top or the bottom (see the figure). Make sure they are not reversed for devices with power supply from the bottom.
- cross-sectional area of 22–16 AWG (0.4 mm² to 1.5 mm²)
- maximum length of 32.8 ft. (10 m).

24 Vdc Power Supply Module

An external 24 Vdc power supply is required for installations with communication networks, regardless of the type of trip unit.

On installations without communication networks, the power supply is available as an option for MicroLogic 5/6 to:

- modify settings when the circuit breaker is open (OFF position)
- display measurements when the current flowing through the circuit breaker is low
- maintain the display of the cause of tripping

Power supply, without the communication function, using the terminal block with a backup battery.

Power supply, with the communication function, using the Modbus interface.

To determine the power requirements of the devices, see [Power Requirements](#), page 110.

H- and J-Frame Motor Circuit Protector

**POWERPACT H/J FRAME MOTOR CIRCUIT PROTECTOR
WITH AUTO SETTINGS
CHARACTERISTIC TRIP CURVE NO. 045-2**

The time-current curve information represents the typical response and is to be used for application and coordination purposes only.

Curves apply from -30C to +60C ambient temperature.

- Notes:**
- The MCP is an instantaneous only breaker that detects the peaks of the current. In order to trip within the specified time-current levels, consecutive peaks of the current must exceed the selected setting's threshold.
 - Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.
 - The time-current curve represents single-phase to three-phase fault currents.

PowerPacT H-Frame Electronic Trip Circuit Breakers— 60/100/150 A Frame

MicroLogic 3.2 Electronic Trip Unit Long Time Trip Curve

MICROLOGIC™ ELECTRONIC TRIP UNITS MicroLogic™ 3.2 Long Time Trip Curve 60A, 100A, 150A H-Frame

The time-current curve information is to be used for application and coordination purposes only.

Notes:

1. There is a thermal-imaging effect that can act to shorten the long-time delay. The thermal imaging effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately 20 minutes is required between overloads to completely reset thermal-imaging.

2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.

Curves apply from -35°C to +70°C (-31°F to +158°F) ambient temperature.

MicroLogic 3.2S Electronic Trip Unit Long Time / Short Time Trip Curve

MICROLOGIC™ ELECTRONIC TRIP UNITS MicroLogic™ 3.2S Long Time/ Short Time Trip Curve 60A, 100A, 150A H-Frame

Approximately 20 minutes is required between overloads to completely reset thermal-imaging.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.

Curves apply from -35°C to +70°C (-31°F to +158°F) ambient temperature.

MicroLogic 6.2A, 6.2A-W, 6.2E, and 6.2E-W Electronic Trip Unit Ground Fault Trip Curve

MICROLOGIC™ ELECTRONIC TRIP UNITS MicroLogic™ 6.2A, 6.2A-W, 6.2E, and 6.2E-W Ground Fault Trip Curve 250A J-Frame

The time-current curve information is to be used for application and coordination purposes only.

1. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.

Curves apply from -35°C to +70°C (-31°F to +158°F) ambient temperature.

MicroLogic 2.2 M Electronic Trip Unit Overload Trip Curve

MICROLOGIC™ ELECTRONIC TRIP UNITS
MicroLogic™ 2.2M Overload Trip Curve
30A, 50A, 100A, 150A H-Frame, 250A J-Frame

The time-current curve information is to be used for application and coordination purposes only.

Notes:

1. If overload still exists past overload relay delay, MCP will open 0.4 seconds later.
 2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.
 3. Isd minimum and maximum only shown.
 4. $I_i = 15 \times I_n$
 $I_n = 30A, 50A, 100A, 150A, 250A$
MCP will trip <30ms at $15 \times I_n$
- Curves apply from -35°C to +70°C (-31°F to +158°F) ambient temperature.

PowerPacT L-Frame Electronic Trip Circuit Breakers— 250/400/600 A Frame

MicroLogic 3.3 and 3.3-W Electronic Trip Unit Long Time Trip Curve

MICROLOGIC™ ELECTRONIC TRIP UNITS MicroLogic™ 3.3 and 3.3-W Long Time Trip Curve 250A, 400A L-Frame

The time-current curve information is to be used for application and coordination purposes only.

Notes:

1. There is a thermal-imaging effect that can act to shorten the long-time delay. The thermal imaging effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately 20 minutes is required between overloads to completely reset thermal-imaging.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.

Curves apply from -35°C to $+70^{\circ}\text{C}$ (-31°F to $+158^{\circ}\text{F}$) ambient temperature.

MicroLogic 3.3S and 3.3S-W Electronic Trip Unit Long Time/Short Time Trip Curve

MICROLOGIC™ ELECTRONIC TRIP UNITS MicroLogic™ 3.3S and 3.3S-W Long Time/Short Time Trip Curve 250A, 400A L-Frame

The time-current curve information is to be used for application and coordination purposes only.

Notes:

1. There is a thermal-imaging effect that can act to shorten the long-time delay. The thermal imaging effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately 20 minutes is required between overloads to completely reset thermal-imaging.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.

Curves apply from -35°C to +70°C (-31°F to +158°F) ambient temperature.

The graph illustrates the relationship between pickup height (multiples of I_n) and time in seconds. The y-axis is logarithmic, ranging from 0.005 to 10000 seconds. The x-axis is linear, ranging from 1 to 100 multiples of I_n . The curves represent different pickup heights: 1.5x, 2x, 3x, 4x, 5x, 6x, 8x, 10x, and 12x. A shaded region at the bottom indicates the time for 1 cycle and 1/2 cycle.

1. There is a thermal-imaging effect that can act to shorten the long-time delay. The thermal imaging effect comes into play if a current above the long-time delay pickup value exists for a time and then is cleared by the tripping of a downstream device or the circuit breaker itself. A subsequent overload will cause the circuit breaker to trip in a shorter time than normal. The amount of time delay reduction is inverse to the amount of time that has elapsed since the previous overload. Approximately 20 minutes is required between overloads to completely reset thermal-imaging.
2. Total clearing times shown include the response times of the trip unit, the circuit breaker opening, and the extinction of the current.
3. In = Maximum dial setting of Ir.
250A L-Frame: In = 250A = Max Ir setting

Curves apply from -35°C to +70°C (-31°F to +158°F) ambient temperature.
